

# 프로그래밍 언어와 기계 학습의 만남

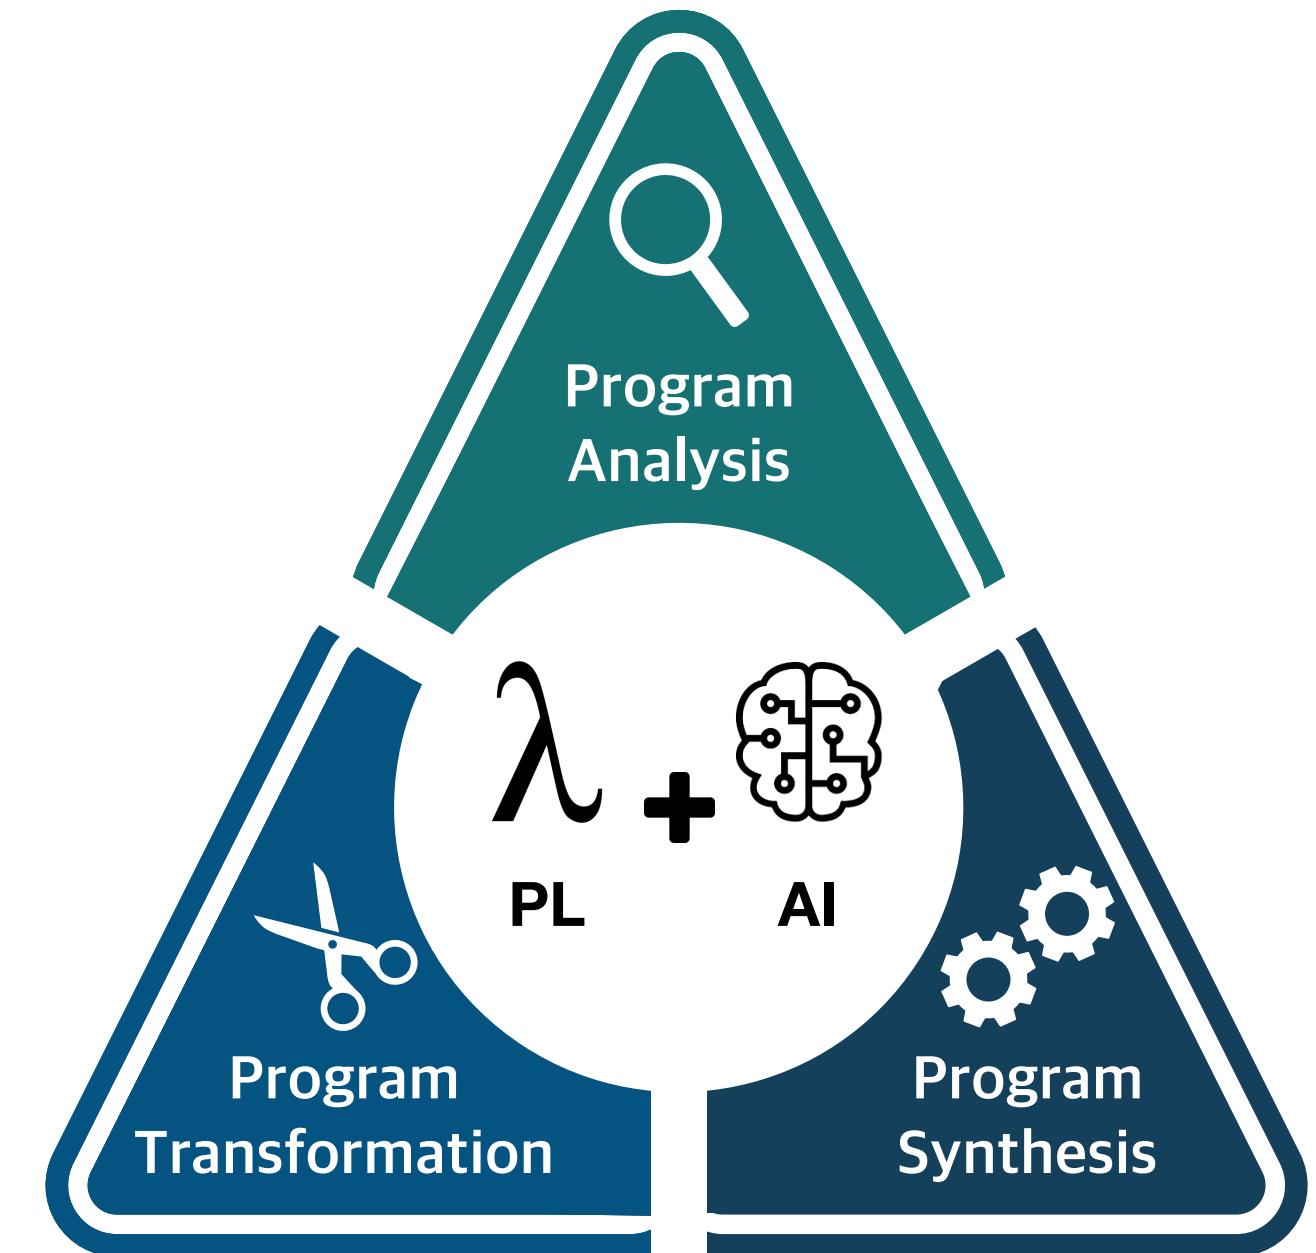

허기홍

전산학부 / 프로그래밍 시스템 연구실  
제 2회 KAIST PL 워크샵

# 몇 가지 경험과 사례

- 프로그램 분석
  - 유연한 프로그램 분석을 위한 **지도 학습, 강화 학습**
  - 편리한 프로그램 분석을 위한 **베이지안 추론**
- 프로그램 변환과 합성
  - 빠른 합성을 위한 **언어 모델**
  - 빠른 변환을 위한 **강화 학습**

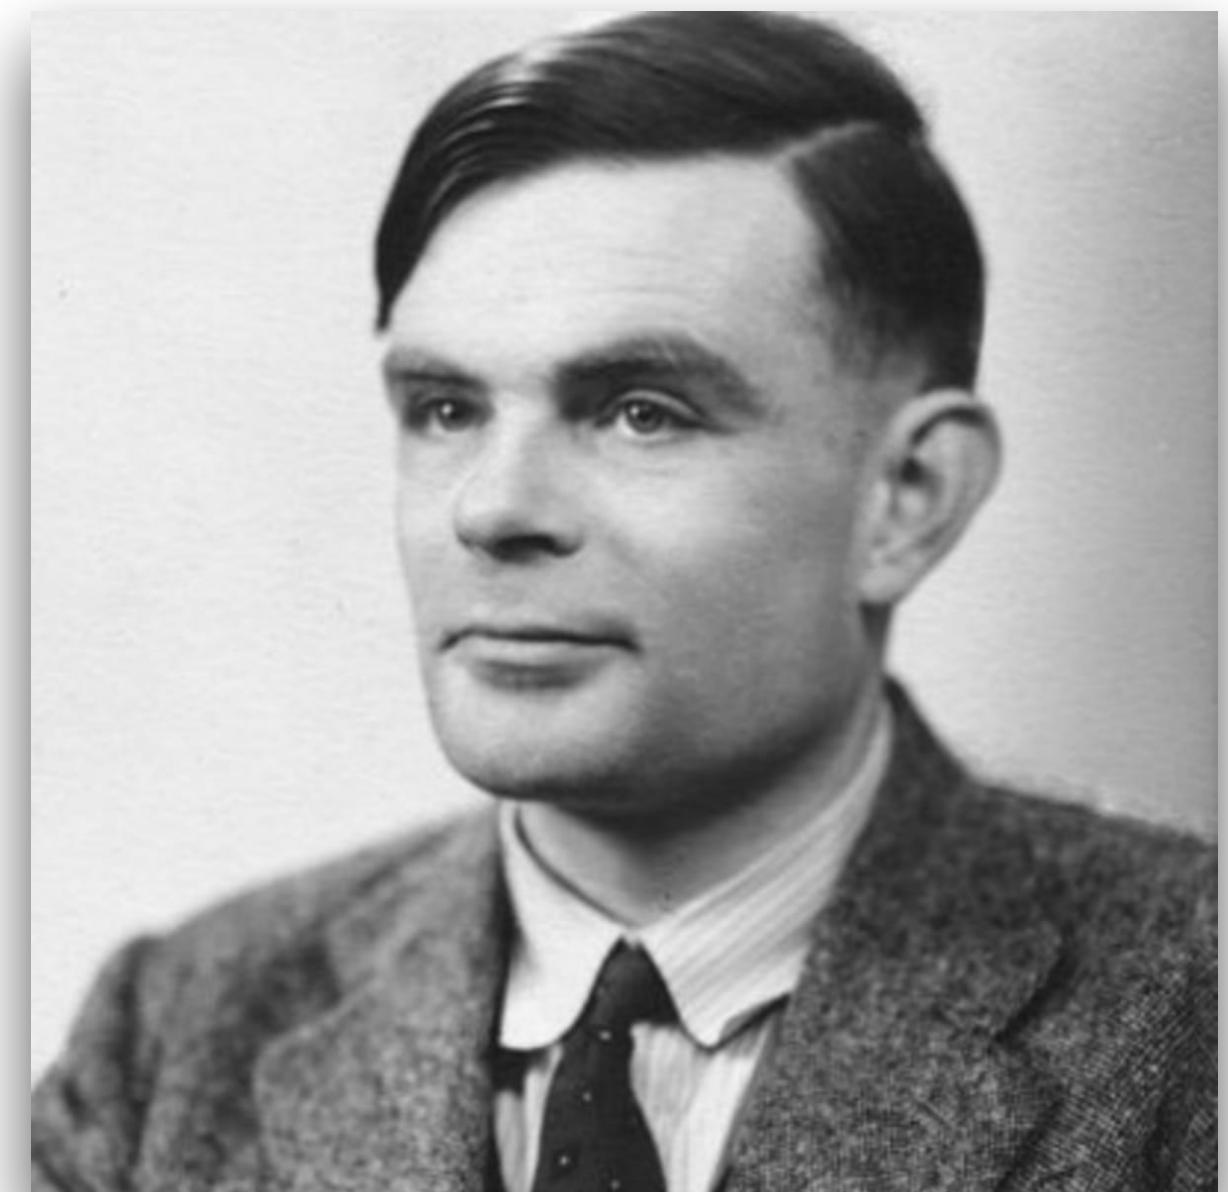

# 자동 프로그래밍

**“Instruction tables will have to be made up by mathematicians with computing experience and perhaps a certain puzzle-solving ability.**

...

**There need be no real danger of it ever becoming a drudge, for any processes that are quite mechanical may be turned over to the machine itself.”**

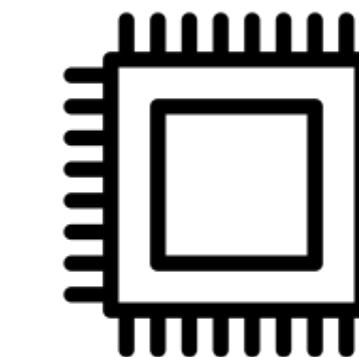

- A. M. Turing, “Proposed Electronic Calculator”, 1946

# 오늘 이야기

- “PL” 세팅에서 프로그램 변환과 합성을 빠르게 하는 방법
  - “PL” 세팅: 언어의 구문과 의미 구조 + 올바름 판단 방법 (예: 테스트 케이스)이 주어진 상황
- 탐색을 위한 핵심 아이디어
  - 연관성: “프로그램 구문들 사이에는 의미적 연관성이 있다”
  - 규칙성: “프로그램 구문에는 전형적인 패턴이 있다”
  - 연속성: “프로그램 구문이 조금 바뀌면 의미도 조금 바뀐다”

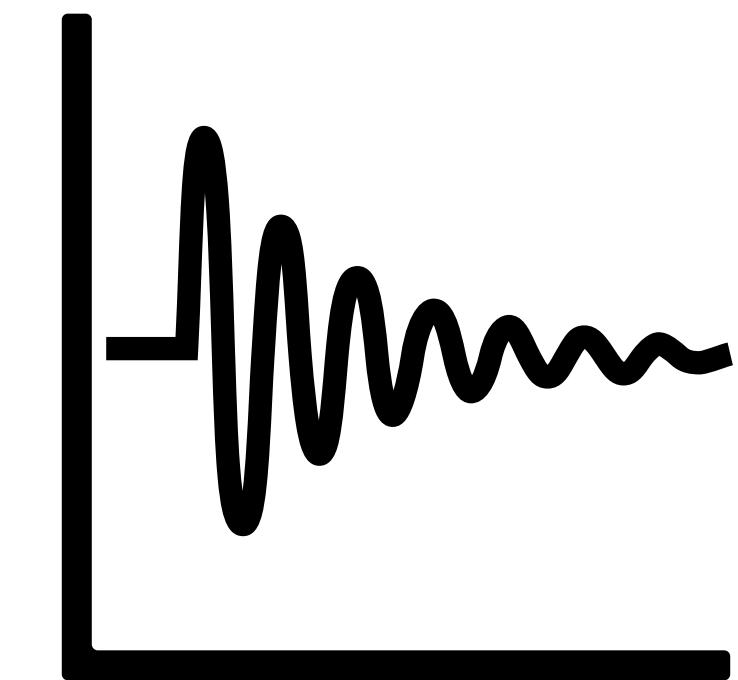

# 세 가지 아이디어

연관성 [CCS'18]

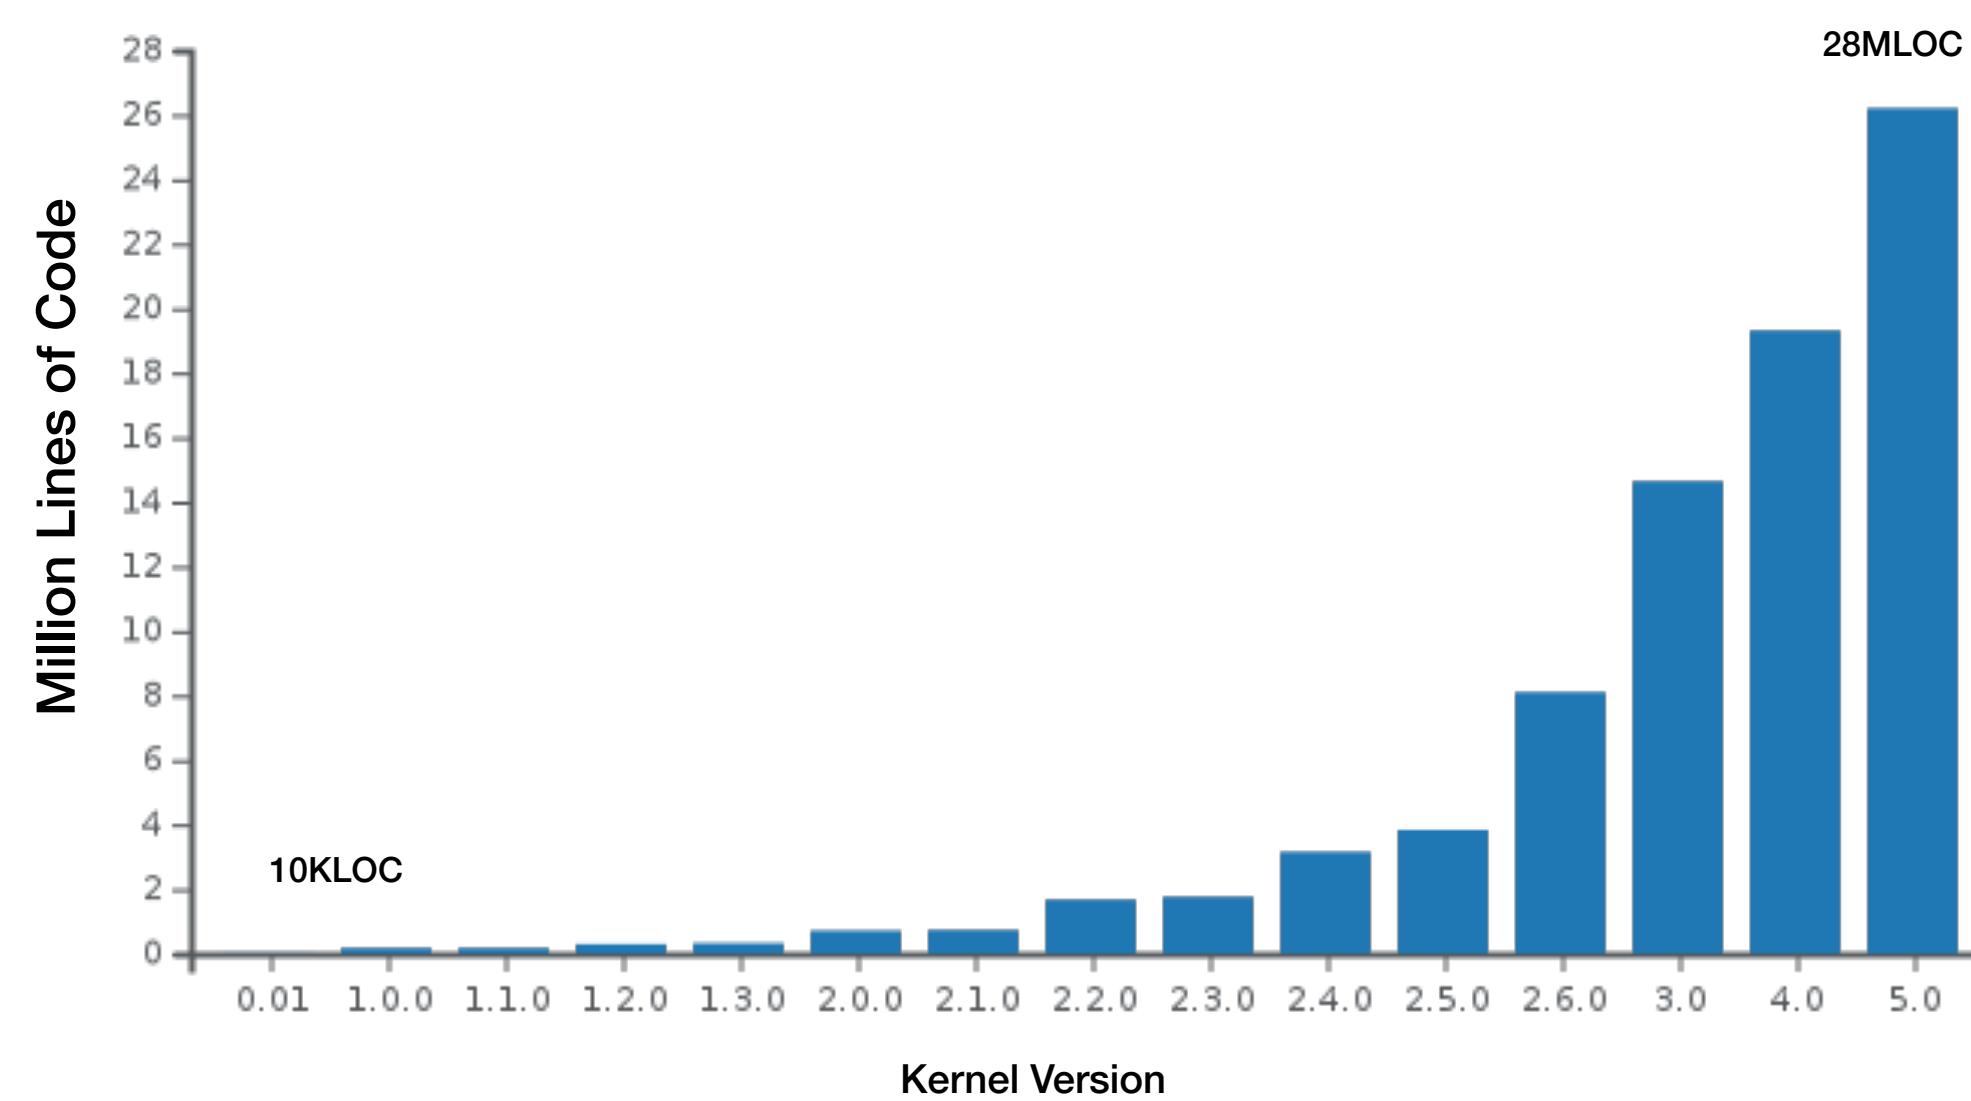

규칙성 [PLDI'18]

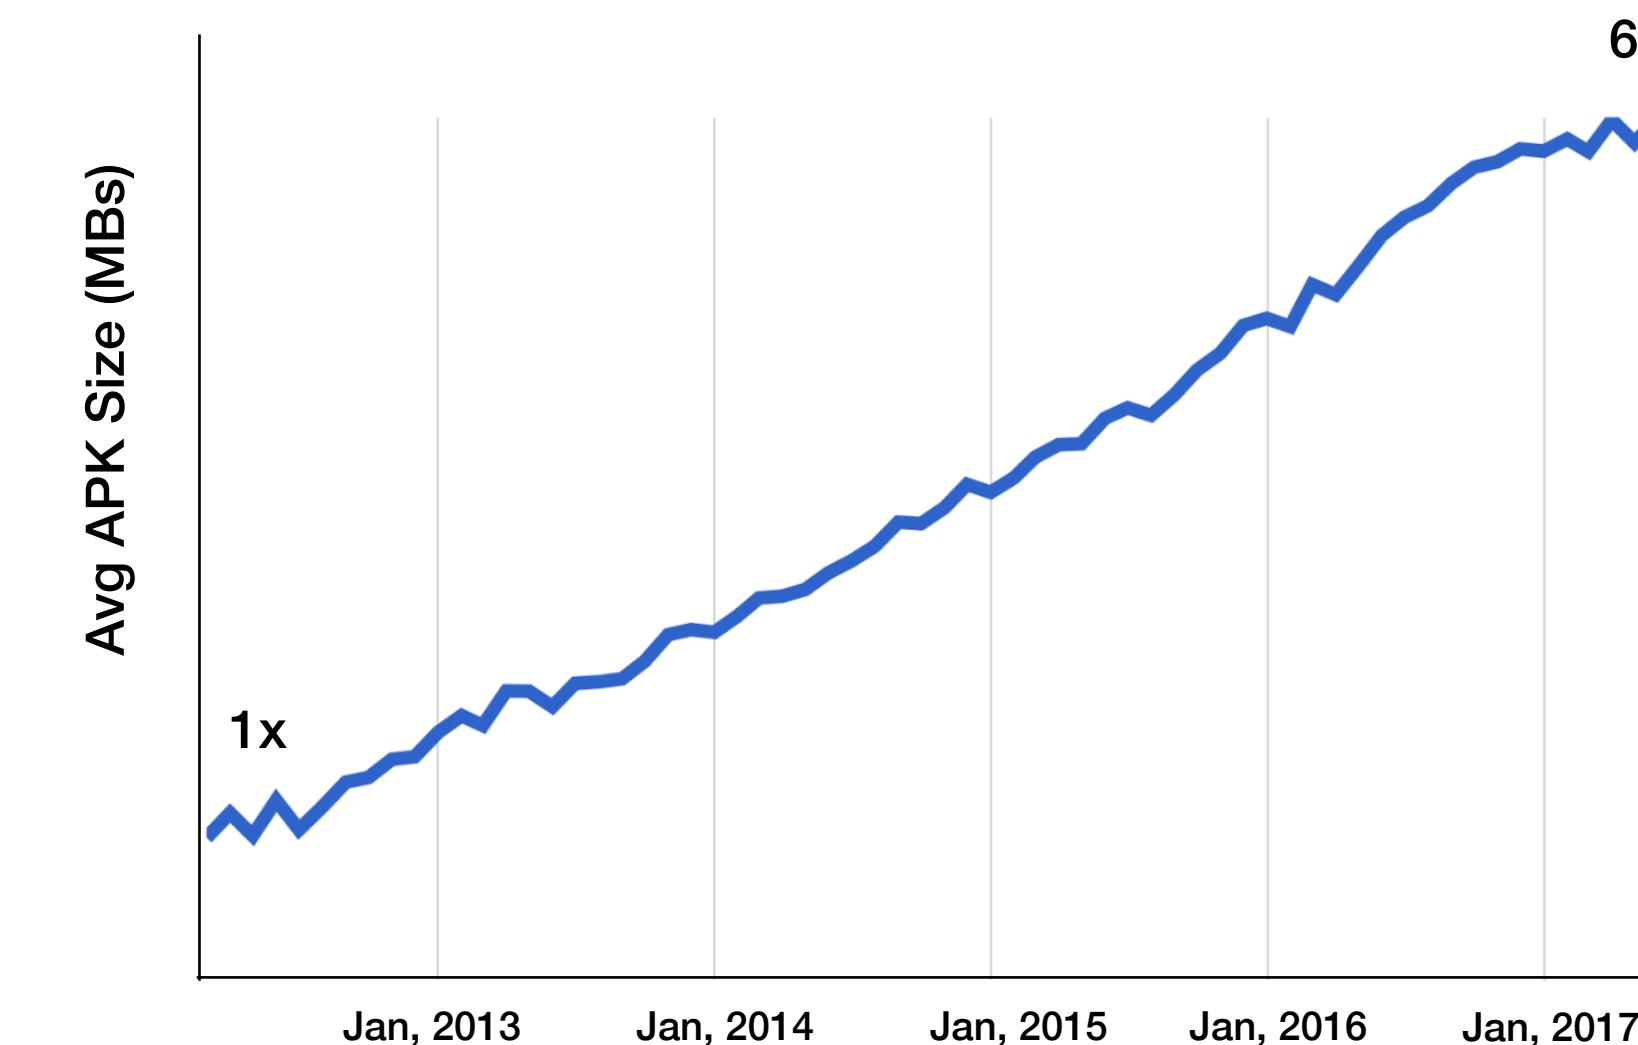

연속성 [IJCAI'19]

# 소프트웨어의 크기와 복잡도

## Size of Linux Kernel

## Avg. Size of Android Apps

# 소프트웨어 거품 (Software Bloat)

Performance

Maintainability

Security

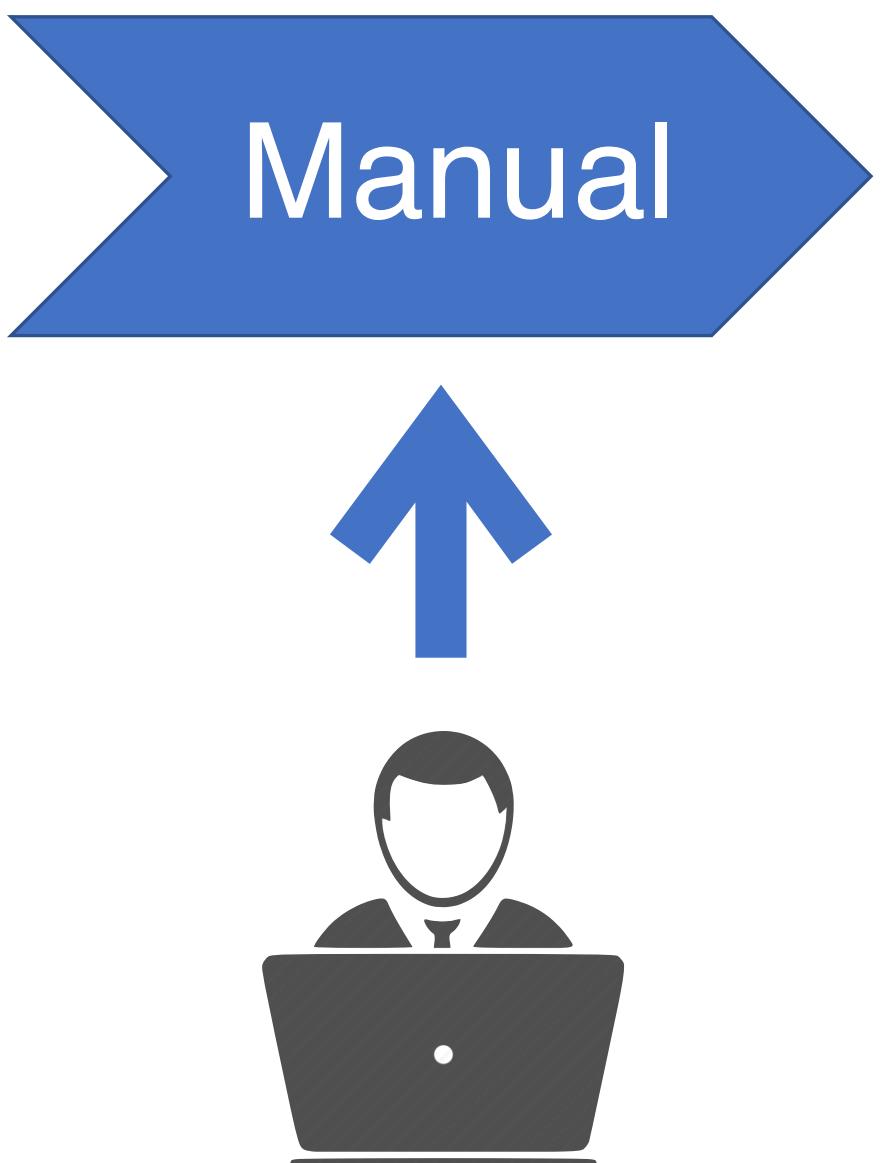

- Example: **security vulnerability** in GNU tar

# 현실

## General-purpose tar

- Out-of-the-box Linux
- 97 cmd line options
- 45,778 LOC
- 13,227 statements
- CVE-2016-6321

## Customized tar

- BusyBox Utility Package\*
- 8 cmd line options
- 3,287 LOC
- 403 statements
- No known CVEs

# 목표

## General-purpose tar

- Out-of-the-box Linux
- 97 cmd line options
- 45,778 LOC
- 13,227 statements
- CVE-2016-6321

## Customized tar

- BusyBox Utility Package\*
- 8 cmd line options
- 1,646 LOC
- 518 statements
- No known CVEs

# Chisel: A Program Debloating System\*

- 다섯 가지 목표:
  - **minimality**: trim code as aggressively as possible
  - **efficiency**: scale to large programs
  - **robustness**: avoid introducing new vulnerabilities
  - **naturalness**: produce maintainable code
  - **generality**: handle a variety of programs and specs

---

\*<https://chisel.cis.upenn.edu>

# Example: tar-1.14

```
int absolute_names;
int ignore_zeros_option;
struct tar_stat_info stat_info;

char *safer_name_suffix (char *file_name, int link_target) {
    int prefix_len;
    char *p;

    if (absolute_names) {
        p = file_name;
    } else {
        /* CVE-2016-6321 */
        /* Incorrect sanitization if "file_name" contains ".." */
        ...
    }
    ...
    return p;
}

void extract_archive() {
    char *file_name = safer_name_suffix(stat_info.file_name, 0);
    /* Overwrite "file_name" if exists */
    ...
}

void list_archive() { ... }

void read_and(void *(do_something)(void)) {
    enum read_header status;
    while (...) {
        status = read_header();
        switch (status) {
        case HEADER_SUCCESS: (*do_something)(); continue;
        case HEADER_ZERO_BLOCK:
            if (ignore_zeros_option) continue;
            else break;
        ...
        default: break;
    }
    ...
}

/* Supports all options: -x, -t, -P, -i, ... */
int main(int argc, char **argv) {
    int optchar;
    while (optchar = getopt_long(argc, argv) != -1) {

        grep 'Segmentation fault' log && exit 1
    done
    return 0
}

compile || exit 1
desired || exit 1
undesired || exit 1
```

# Key Questions

# Program Debloating by Delta Debugging\*

- Oracle  $O$  takes a program and returns **PASS** or **FAIL**
- Given a program  $P$ , find a **1-minimal**  $P^*$  such that  $O(P^*) = \text{PASS}$
- **1-minimal:** removing any single element of  $P^*$  does not pass  $O$
- Time complexity:  $O(|P|^2)$

\*Zeller and Hildebrandt, simplifying and isolating failure-inducing input, TSE, 2002

# Example

- Property of interest: termination with return code zero

**Original**

```
int f1() { return 0; }
int f2() { return 1; }
int f3() { return 1; }
int f4() { return 1; }
int f5() { return 1; }
int f6() { return 1; }
int f7() { return 1; }
int main() { return f1(); }
```

**Minimal version**

```
int f1() { return 0; }
int main() { return f1(); }
```

\*All duplications are omitted

# 델타 디버깅의 문제

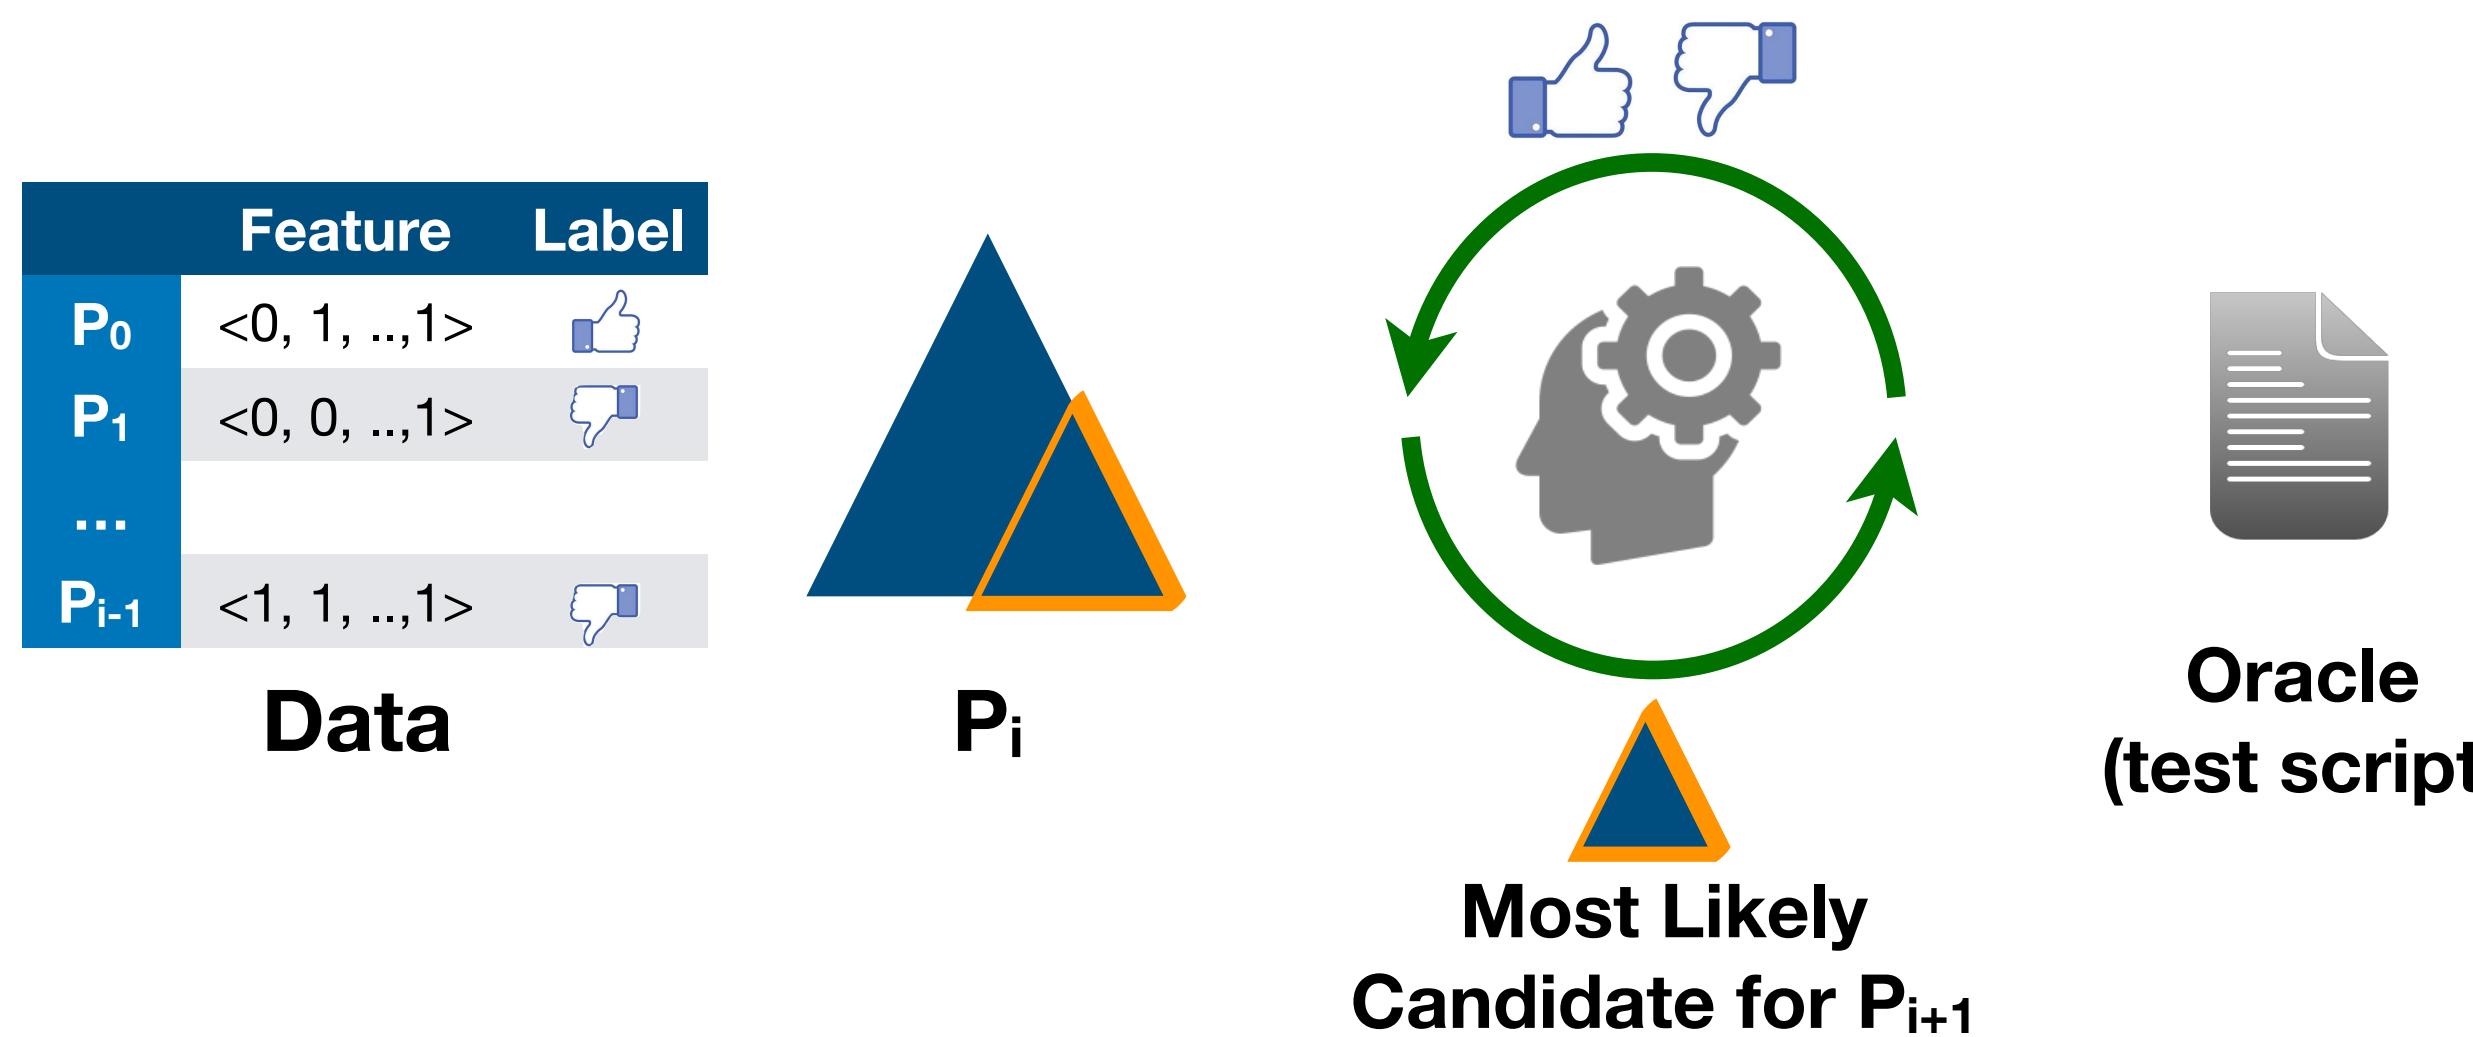

- Oracle  $O$  takes a program and returns **PASS** or **FAIL**
- Given a program  $P$ , find a **1-minimal**  $P^*$  such that  $O(P^*) = \text{PASS}$
- **1-minimal:** removing any single element of  $P^*$  does not pass  $O$
- Time complexity:  $O(|P|^2)$

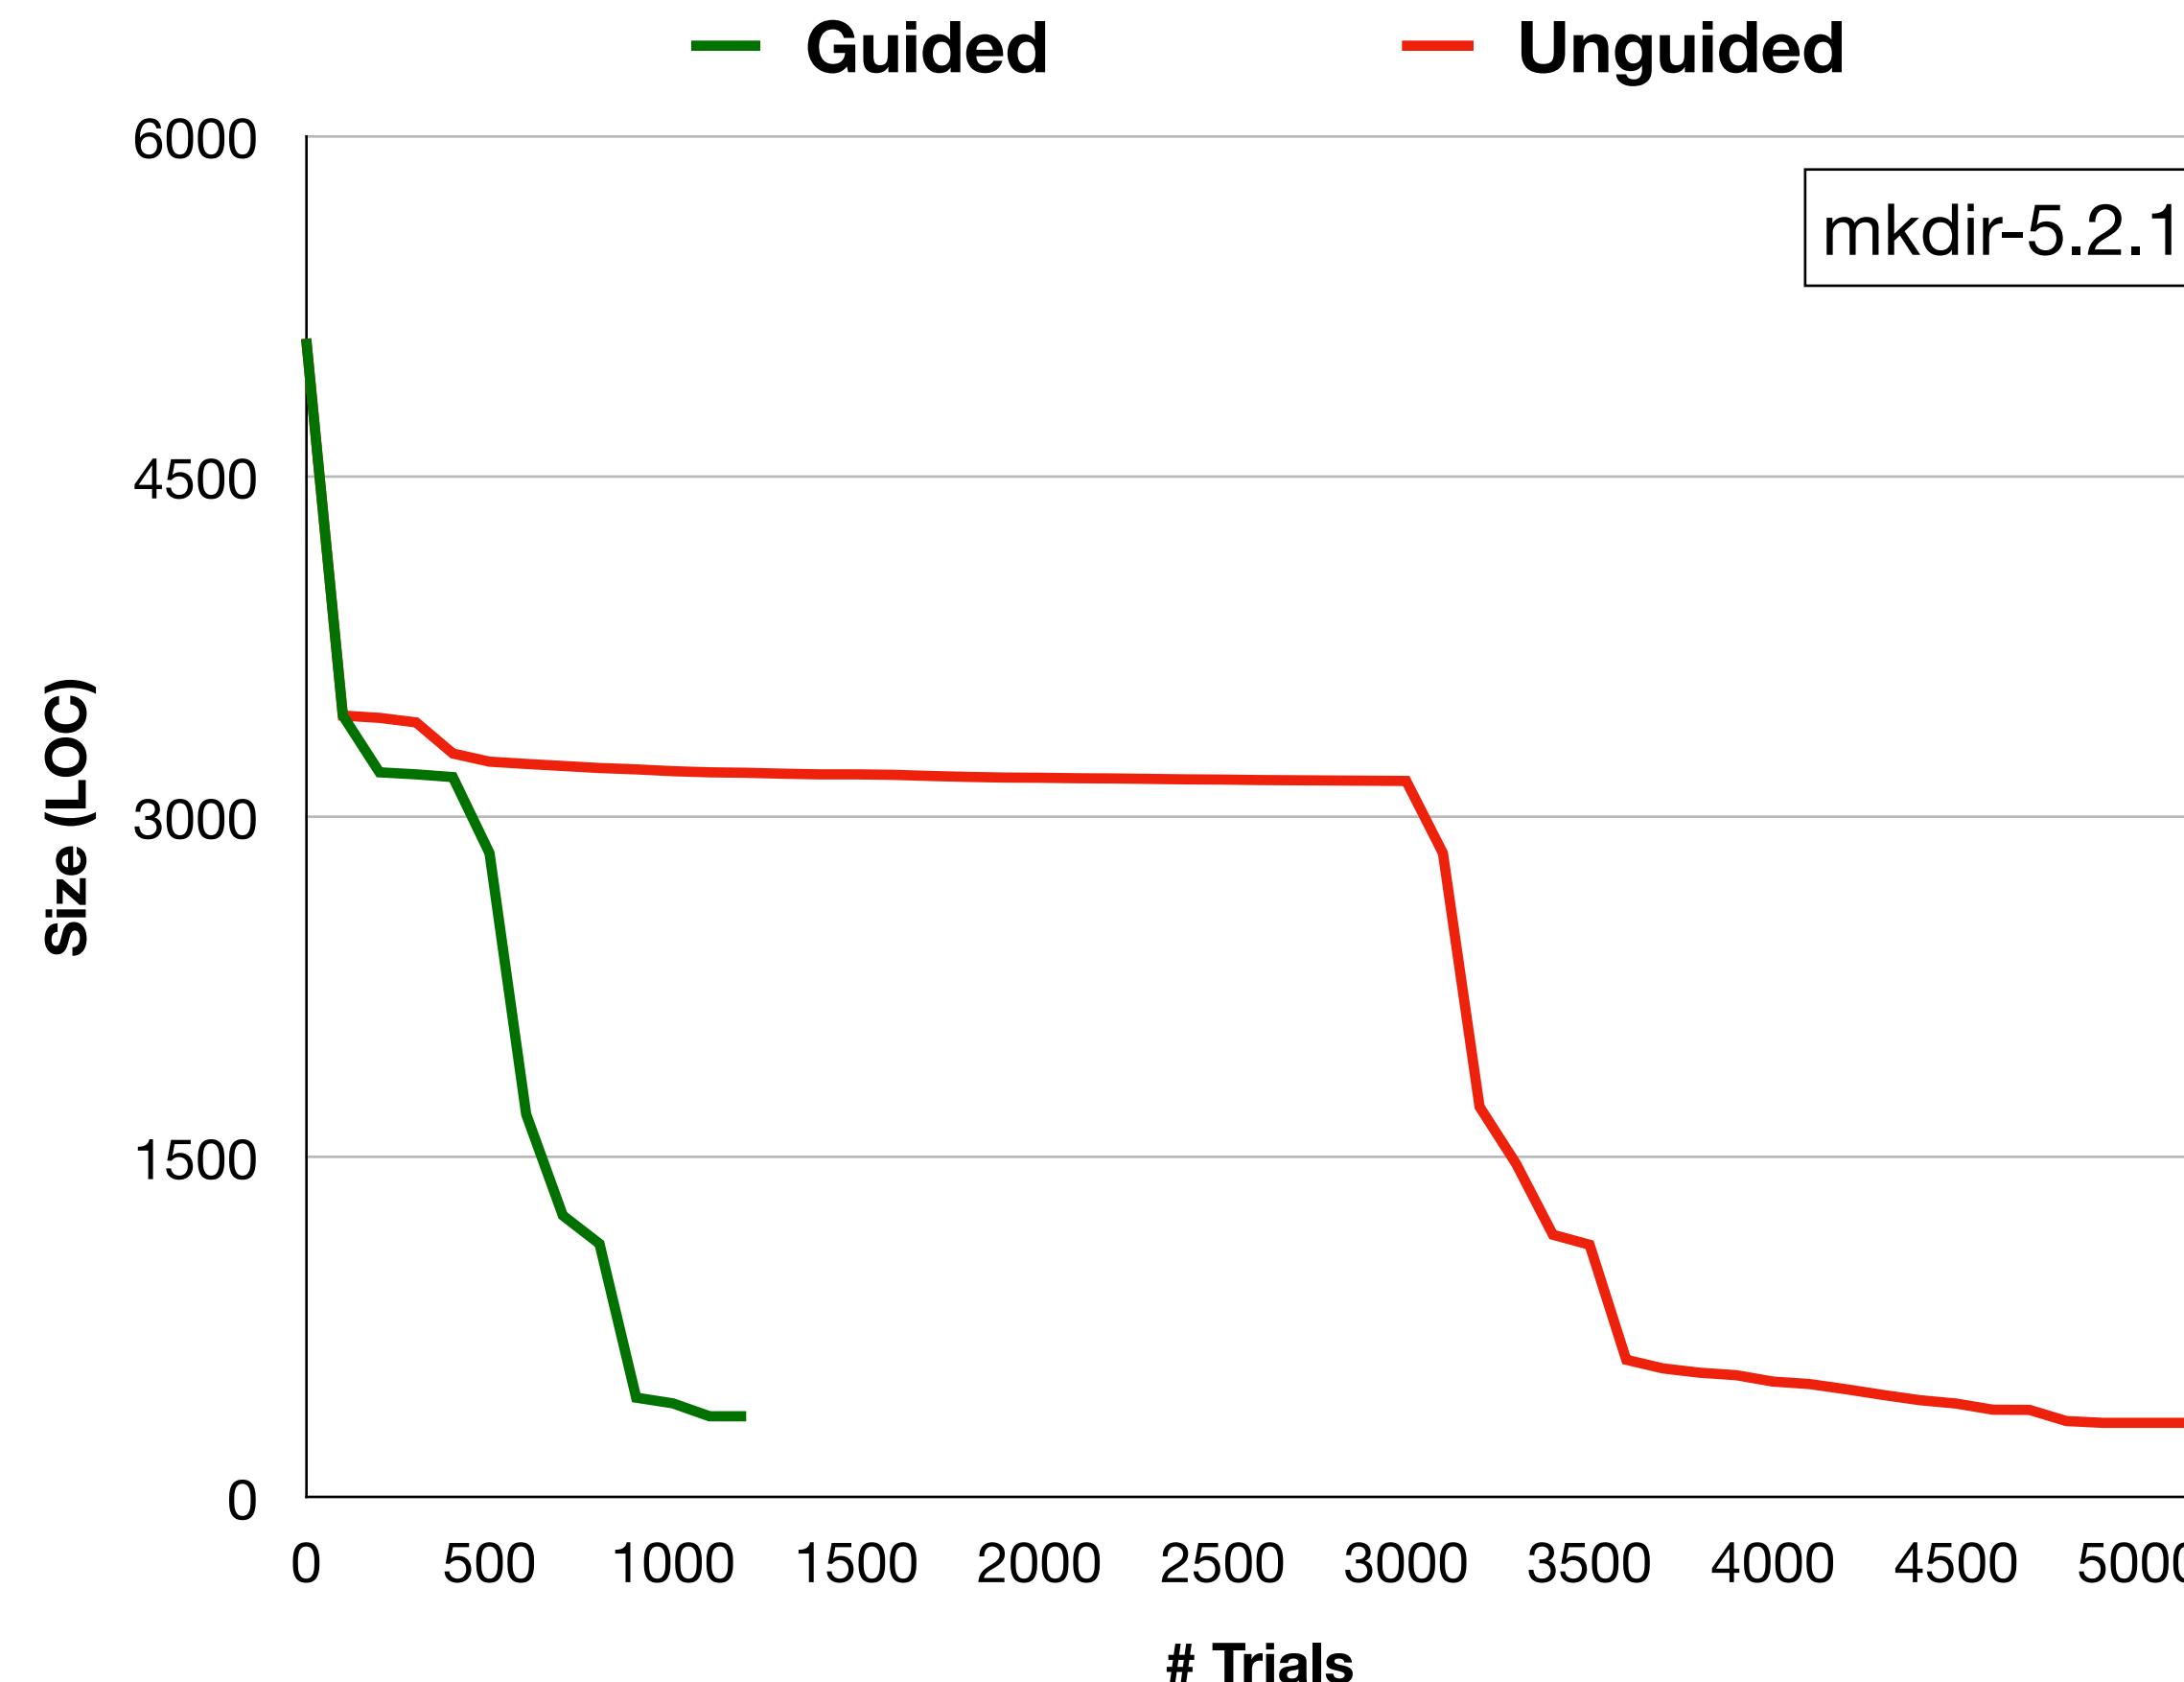

\*Zeller and Hildebrandt, simplifying and isolating failure-inducing input, TSE, 2002

# Learning-guided Delta Debugging

- **Learn a policy** for DD using reinforcement learning (RL)
- **Guide the search** based on the prediction of the learned policy
- Still guarantee **1-minimality** and  **$O(|P|^2)$**  time complexity

# Effectiveness

# Example

```
/* mkdir-5.2.1 */
int xstrtol(char *s, char **ptr, int strtol_base, strtol_t *val,
            char *valid_suffixes) {
1: err = 0;
2: assert(0 <= strtol_base && strtol_base <= 36);
3: p = ptr ? ptr : &t_ptr;
4: q = s;
5: while(ISSPACE (*q)) ++q;
6: if (*q == '-') return LONGINT_INVALID;
7: errno = 0;
8: tmp = strtol(s, p, strtol_base);
9: if (*p == s) { ... }
10: if (!valid_suffixes) { ... }
11: if (**p != '\0') { ... }
12: *val = tmp;
13: return err;
}
```

: removed code

# Example

```
/* mkdir-5.2.1 */
int xstrtol(char *s, char **ptr, int strtol_base, strtol_t *val,
            char *valid_suffixes) {
1: err = 0;
2: assert(0 <= strtol_base && strtol_base <= 36);
3: p = ptr ? ptr : &t_ptr;
4: q = s;
5: while(ISSPACE (*q)) ++q;
6: if (*q == '-') return LONGINT_INVALID;
7: errno = 0;
8: tmp = strtol(s, p, strtol_base);
9: if (*p == s) { ... }
10: if (!valid_suffixes) { ... }
11: if (**p != '\0') { ... }
12: *val = tmp;
13: return err;
}
```

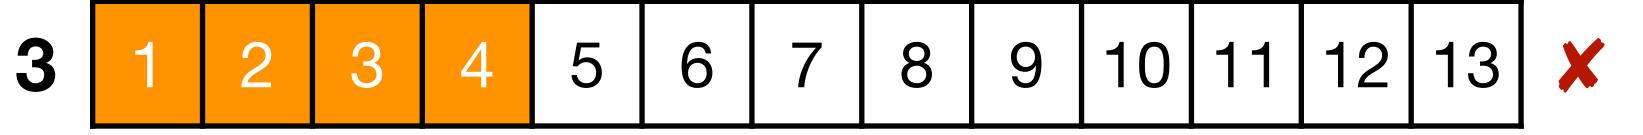

: removed code

5,169 trials (4,872 failures)

## Guided Delta-Debugging

1,174 trials (901 failures)

# Key Questions

# Validation

- Check the **robustness** of the reduced program
  - preventing newly introduced security holes
- Sound static buffer overflow analyzer (Sparrow)
  - #alarms in tar: **1,290 → 19** (feasible for manual inspection)
- Random fuzzer (AFL)
  - no crashing input found in **3 days** for tar

# Augmentation

- Augment the test script with crashing inputs by AFL
- Typically converges in up to 3 iterations in practice
- But, may be incomplete

```
/* grep-2.19 */
void add_tok (token t) {
    /* removed in the first trial and restored after augmentation */
    if (dfa->talloc == dfa->tindex)
        dfa->tokens = (token *) realloc /* large size */ ;
    *(dfa->tokens + (dfa->tindex++)) = t;
}
```

# Experimental Setup

- 10 widely used **UNIX utility programs** (13–90 KLOC)
  - each program has a **known CVE**
  - **remove unreachable code** by static analysis upfront
- Specification:
  - supporting **the same cmd line options** as BusyBox
  - with the **test suites** by the original developers

# Size of Reduced Program

# Reduction Time

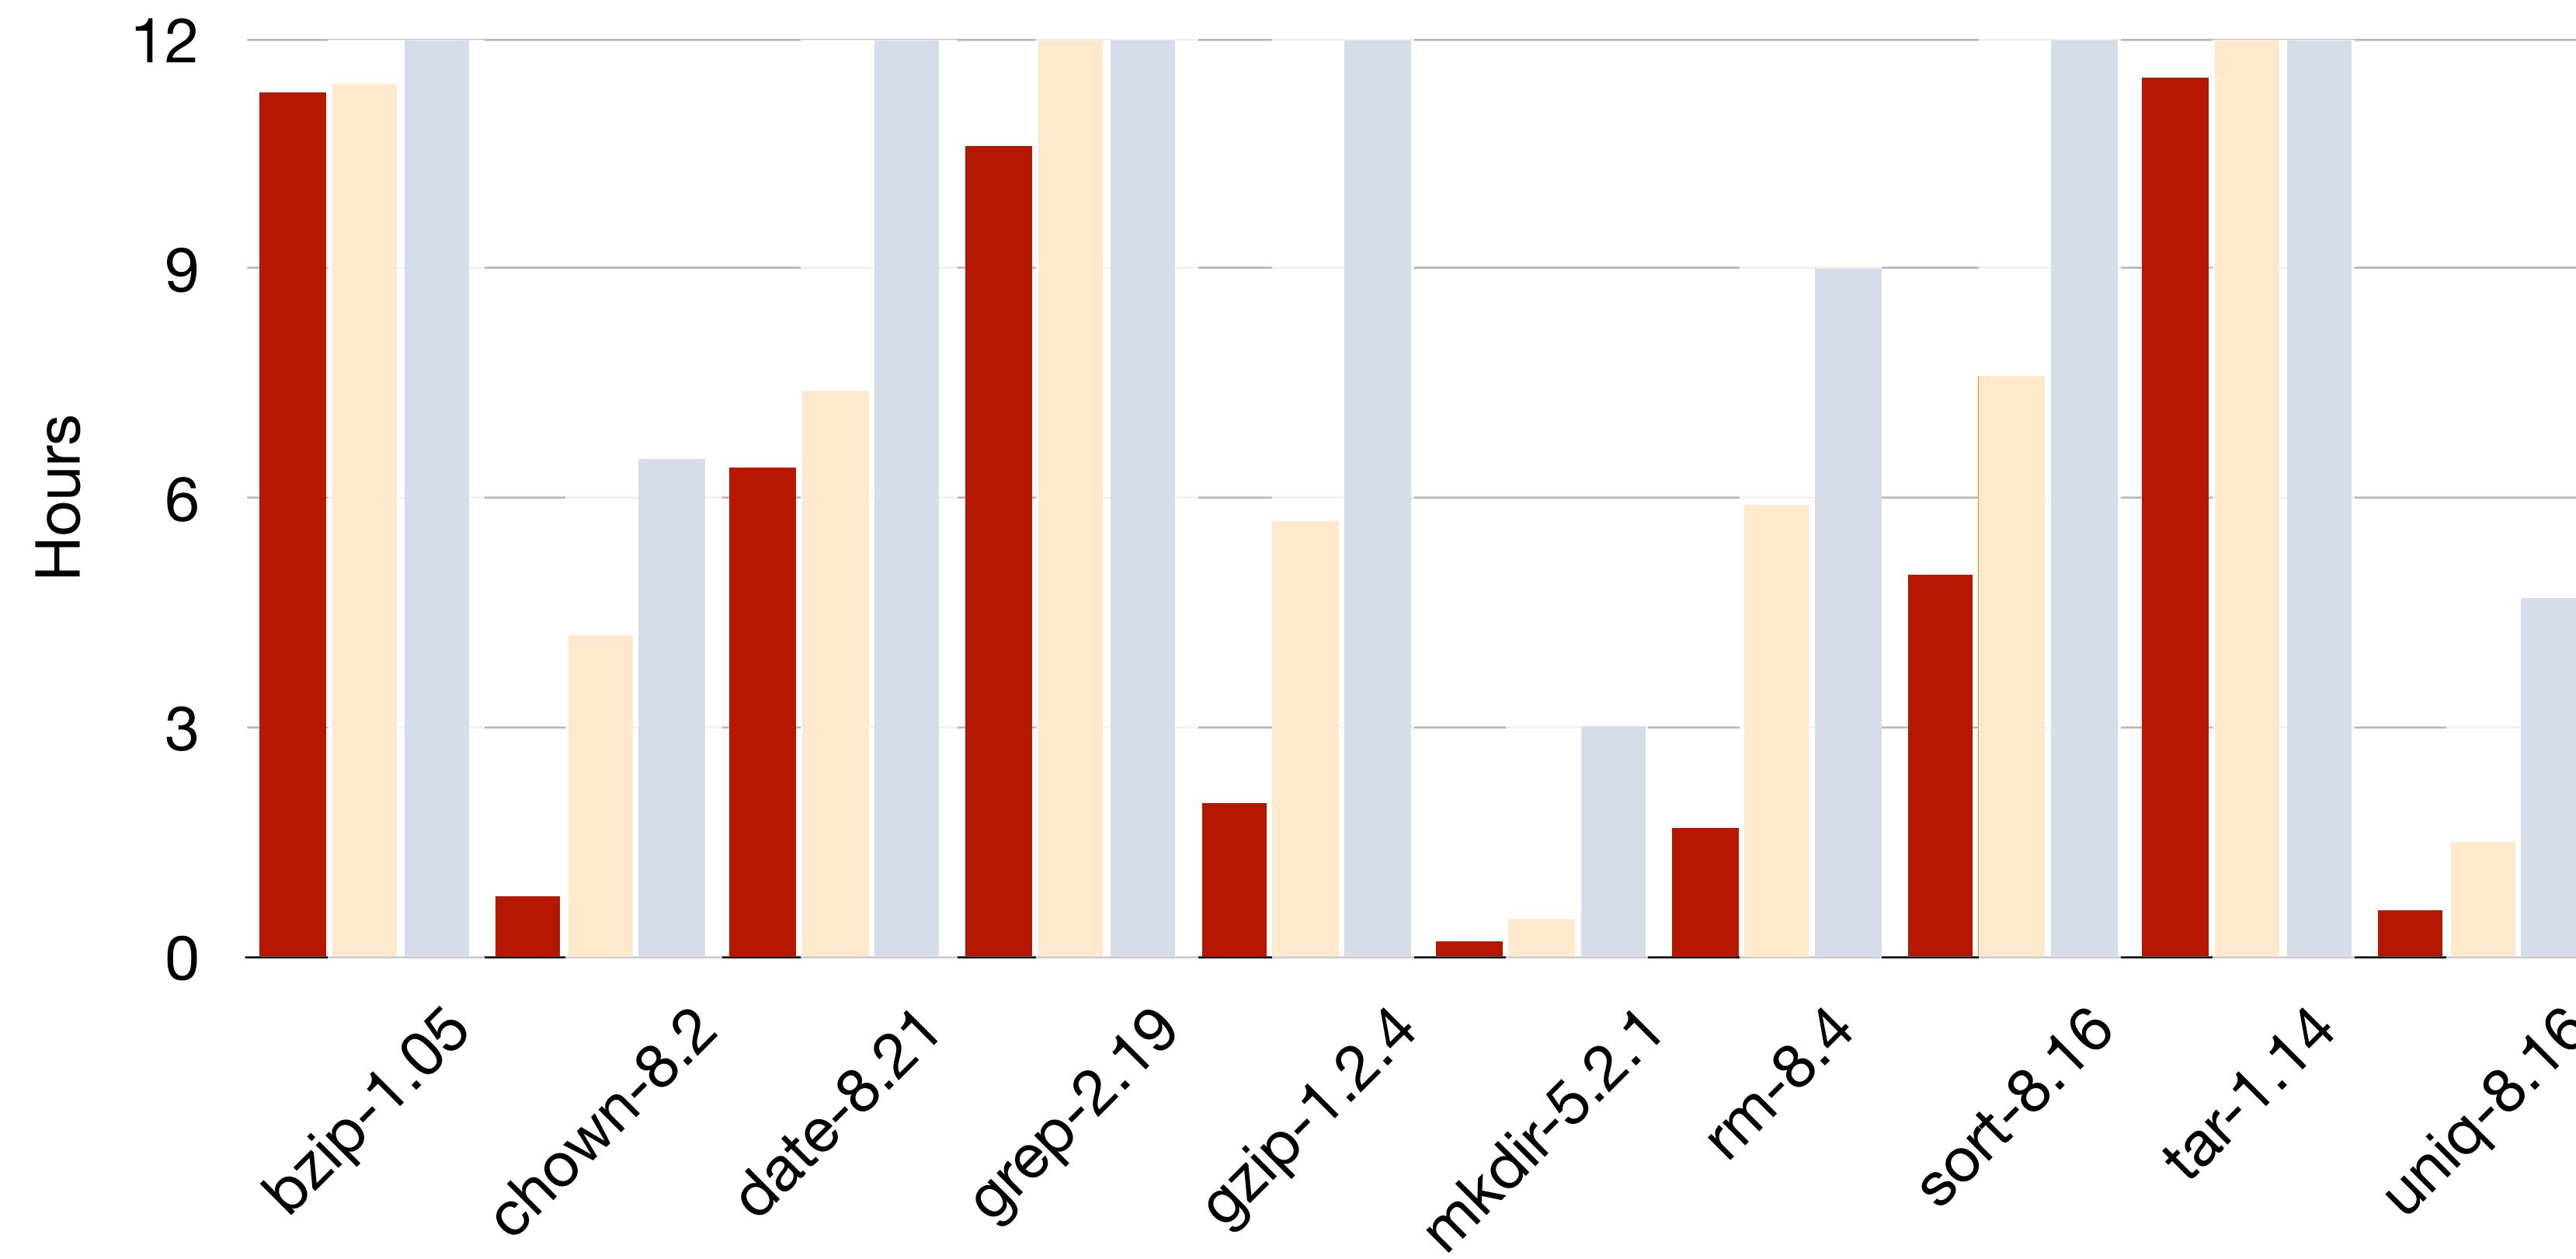

# Reduction Time

# Reduction Time

7x and 4x faster than  
C-Reduce and Perses

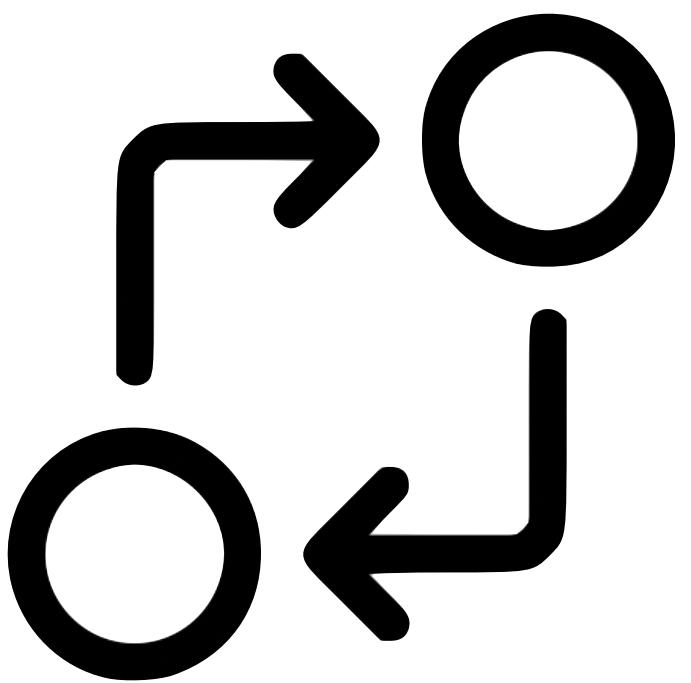

■ Chisel [CCS'18] ■ Perses [ICSE'18] ■ C-Reduce [PLDI'12]

# Summary

- Program debloating: **simplifying and hardening** large & complex SW
- Chisel: automated software debloating system
  - **tractable search** via learning-guided delta debugging
  - **security hardening** by removing undesired features
  - **robustness** via static & dynamic analyses
- Need a lot more research on efficiency and effectiveness
  - E.g., advanced learning techniques, system-level debloating (inter-program)

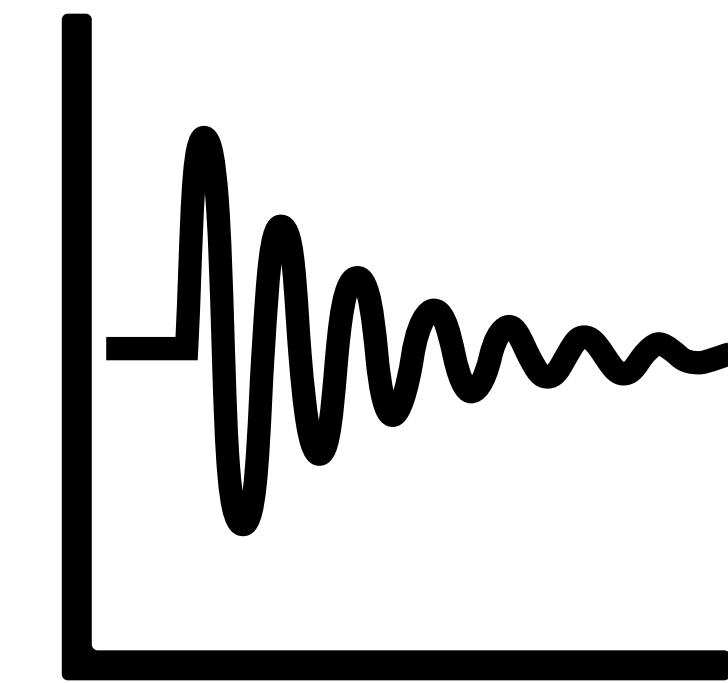

# 세 가지 아이디어

연관성 [CCS'18]

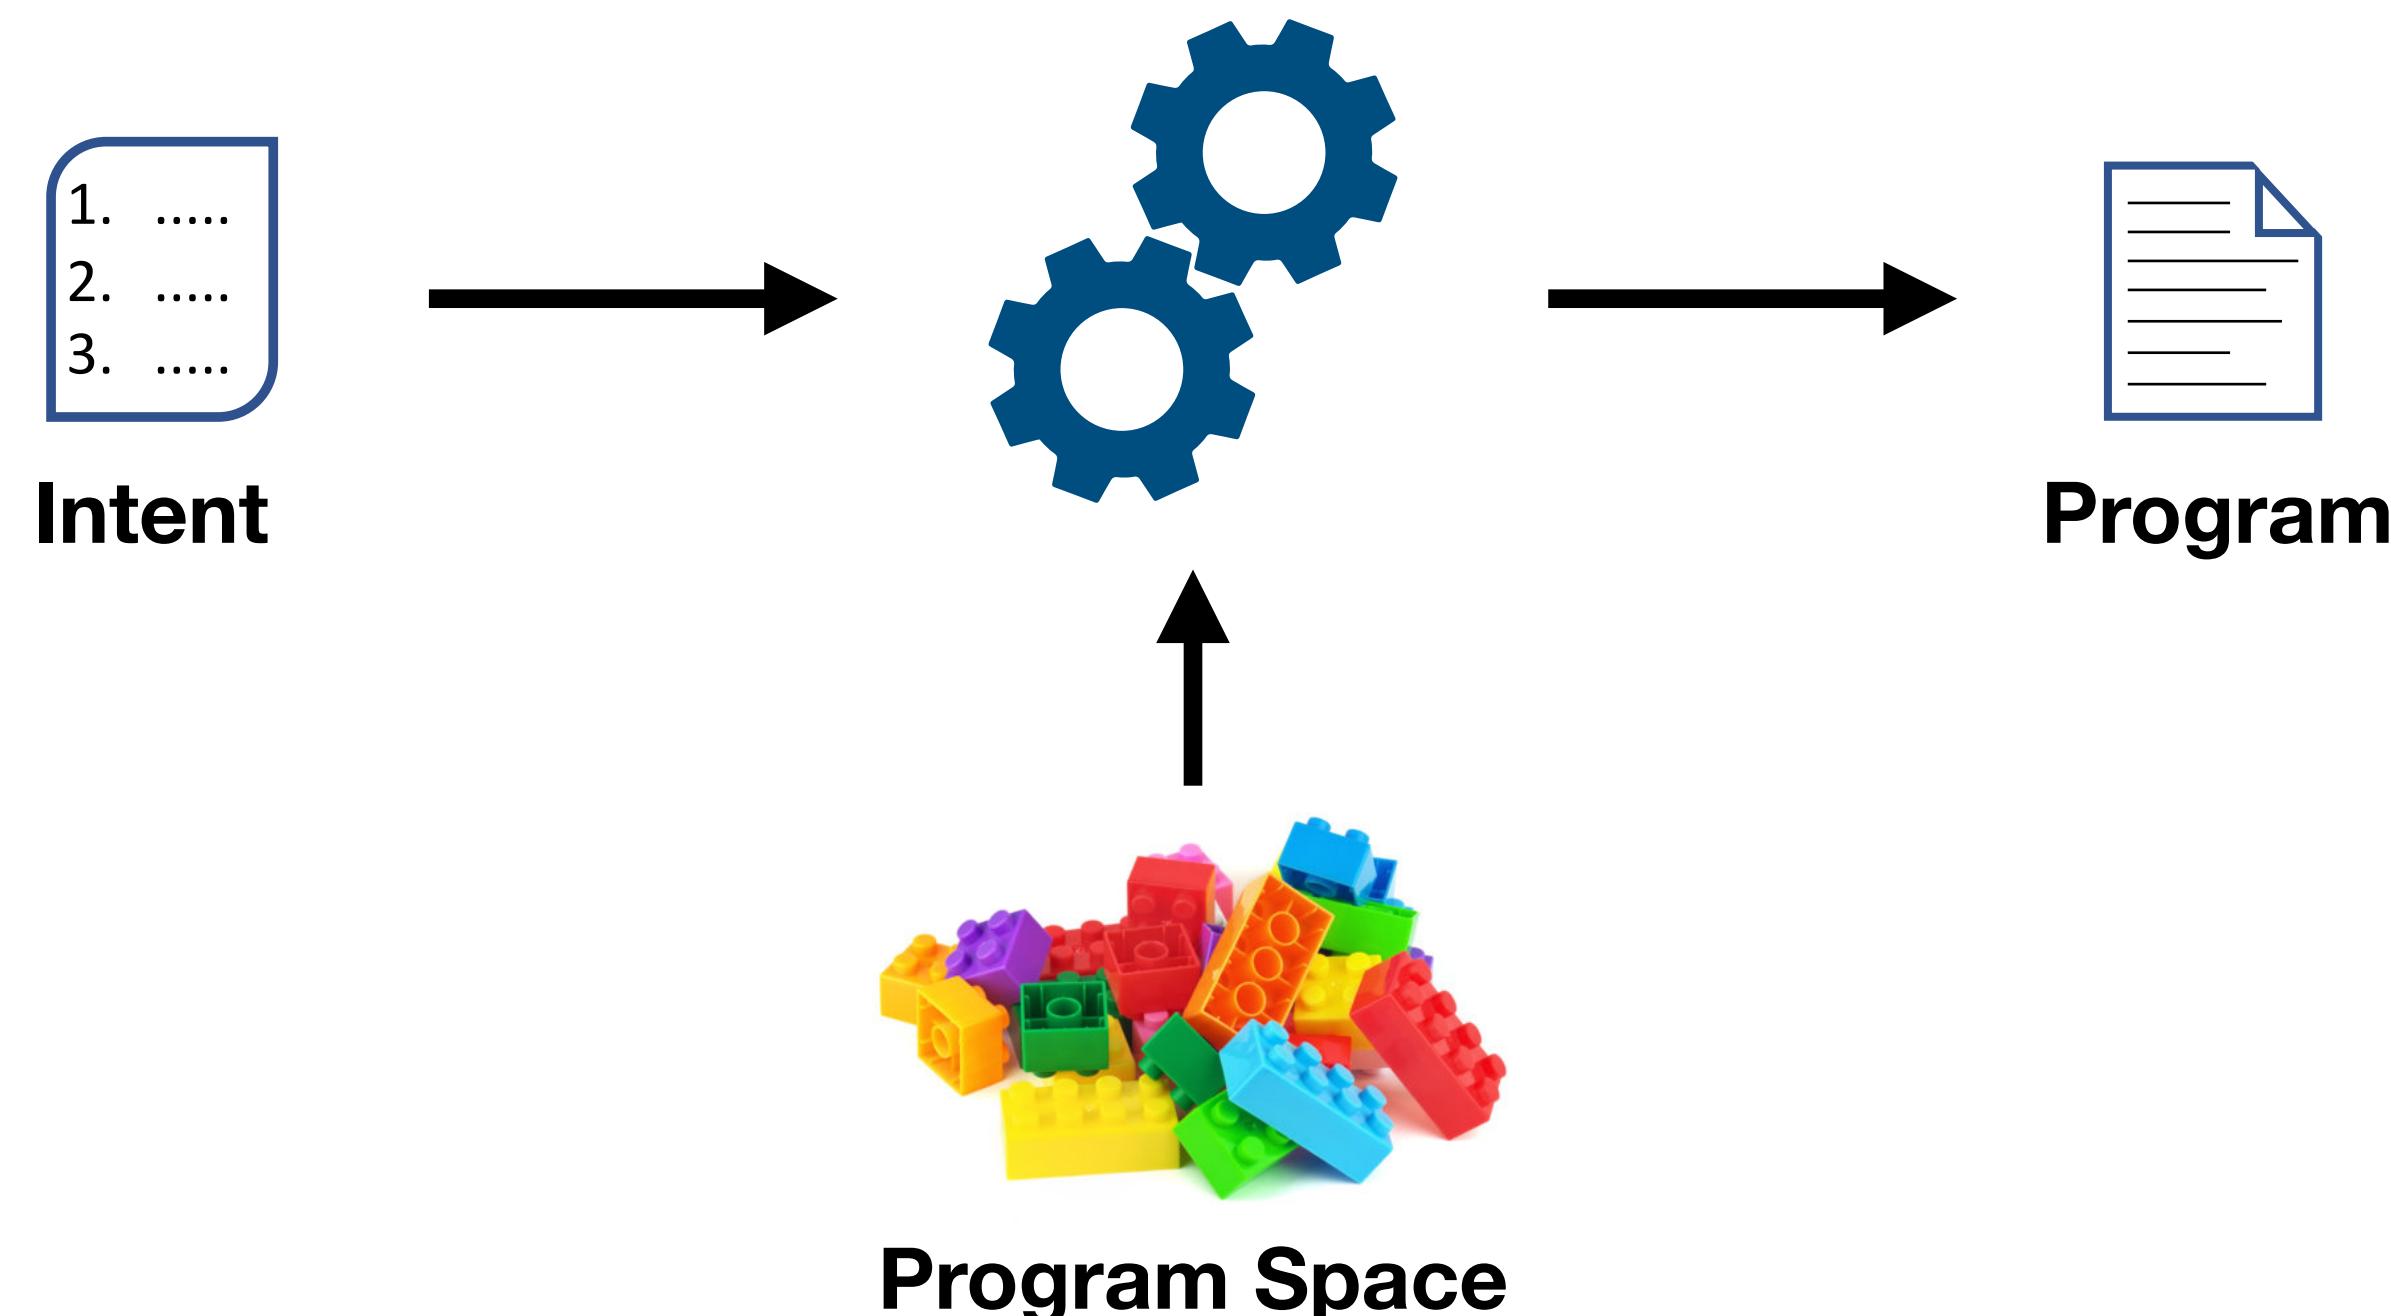

규칙성 [PLDI'18]

연속성 [IJCAI'19]

# 프로그램 합성

- A task of automatically finding a program
  - that satisfy user intent from the underlying program space

# 예제

## Specification

Find a function  $f(x, y)$  where  $f(3,1) = 3 \wedge f(1,2) = 3$

## Grammar

$$S \rightarrow x \mid y \mid S + S \mid S - S \mid \text{if } B \ S \ S$$
$$B \rightarrow S \leq S \mid S = S$$

# 나열식 탐색 (Enumerative Search)

- 원하는 정답을 찾을 때까지 프로그램 후보를 하나하나 나열
- 단순 무식하지만 가장 일반적이어서 널리 쓰이는 방식
  - 여러가지 탐색 공간 최적화와 더불어서 쓰임
- 기존 나열 방식: 프로그램 크기 순 (작은 프로그램 먼저 탐색)
  - 왜? 오컴의 면도날

# 예제

## Specification

Find a function  $f(x, y)$  where  $f(3,1) = 3 \wedge f(1,2) = 3$

## Grammar

$$S \rightarrow x \mid y \mid S + S \mid S - S \mid \text{if } B \ S \ S$$

$$B \rightarrow S \leq S \mid S = S$$

## Enumeration

<b>iter 1</b> <b>iter 2</b> <b>iter 3</b> <b>iter 4</b> ...	$x$	$y$		
	$x + y$	$x - y$	$x \leq y$	$x = y$
	$x + x + y$	$x + x - y$	...	if $(x \leq y) \ y \ x$
	$x + x + x + y$		...	if $(x \leq y) \ (y + x) \ x$

# 단순한 나열식 탐색의 단점

- 단순 나열: 프로그램 크기 순
- 두 가지 문제
  - 속도: 가능한 프로그램 후보가 기하급수적으로 증가
  - 품질: 주어진 입출력 예제에만 우연히 들어맞는 프로그램 생성 가능성 (overfitting)
- 예:  $f(-1,0) = 0 \wedge f(0, -1) = 0$

iter 0	$x$	$y$				
iter 1	$x + x$	$x - x$	$x + y$	...	$x \leq y$	...
iter 2	$x + x + y$	$x + x - y$	...	$\text{if } (x \leq y) y$	$x$	...
iter 3	$x + x + x + y$	...	$\text{if } (x \leq y) (y + x)$	$x$		

But which one is more likely  
to be a solution?

$x - x$  vs.  $\text{if } (x \leq y) y$   $x$

# 프로그램 구조의 통계적 규칙성

# 프로그램 구조의 통계적 규칙성

- 프로그램: **반복되고 예측가능한** 패턴이 자주 등장

```
for (i = 0; i < 100; ??)
```

- 통계적** 프로그램 모델: 프로그램 구조 상의 확률 분포

- E.g., n-gram, probabilistic context-free grammar (PCFG), etc

$$Pr(\text{??} \rightarrow \text{i++} \mid \text{for (i = 0; i < 100; ??)}) = 0.85$$

$$Pr(\text{??} \rightarrow \text{i--} \mid \text{for (i = 0; i < 100; ??)}) = 0.01$$

- 응용: 코드 채우기, 역난독화, 자동 패치 생성

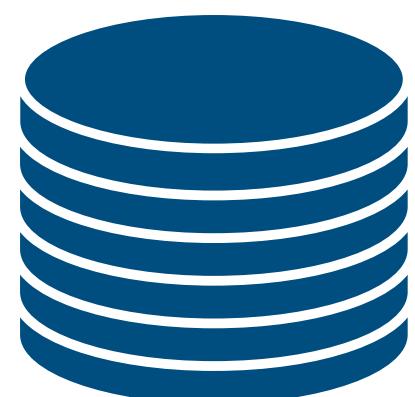

# 해결책: Euphony\*

- 나열방식: 크기가 아닌 **개연성 (likelihood)**
- 확률 모델: 프로그램의 그럴싸함을 계산해주는 함수
  - “이 프로그램이 얼마나 그럴싸한가?”
- **가장 그럴싸한** 프로그램 (확률이 제일 높은) 먼저 시도

\*Lee et al., Accelerating Search-Based Synthesis Using Learned Probabilistic Models, PLDI, 2018

# 확률 모델

- Learn a probabilistic model of programs from a corpus of programs
  - Human-written or auto-generated programs by other synthesizers
  - A wide range of models is applicable

$$Pr(S \rightarrow S + S) = 0.3$$

$$Pr(S \rightarrow x | S + S) = 0.8$$

$$Pr(S \rightarrow x | \dots) = 0.2$$

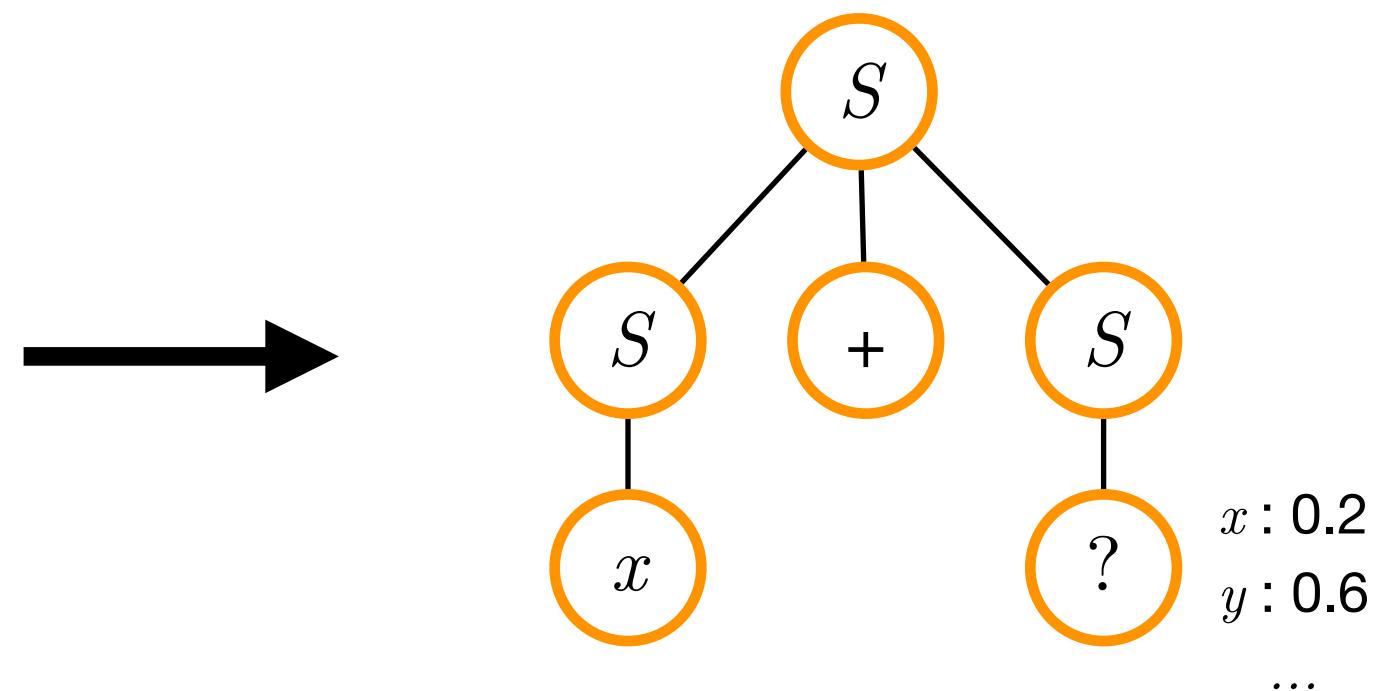

$$Pr(S \rightarrow y | x + S) = 0.6$$

...

Program Corpus

Learned Probabilistic Model

Probability of Programs

# 프로그램의 개연성

- For a CFG  $\langle N, \Sigma, R, S \rangle$ ,
- Given a context, provide the prob. of each production rule:  $\Pr(\text{rule} \mid \text{context})$ 
  - Context: sentential form  $\in (N \cup \Sigma)^*$
- Ultimately assign a probability to each program
- Example:

**CFG**     $S \rightarrow x \mid 1 \mid S + S$

**Probability of “x + 1”**

$$\frac{S \rightarrow S + S \rightarrow x + S \rightarrow x + 1}{\text{_____}}$$

$$\Pr(x + 1) = \boxed{\Pr(S \rightarrow S + S \mid S)} \times \boxed{\Pr(S \rightarrow x + S \mid S + S)} \times \boxed{\Pr(S \rightarrow x + 1 \mid x + S)}$$

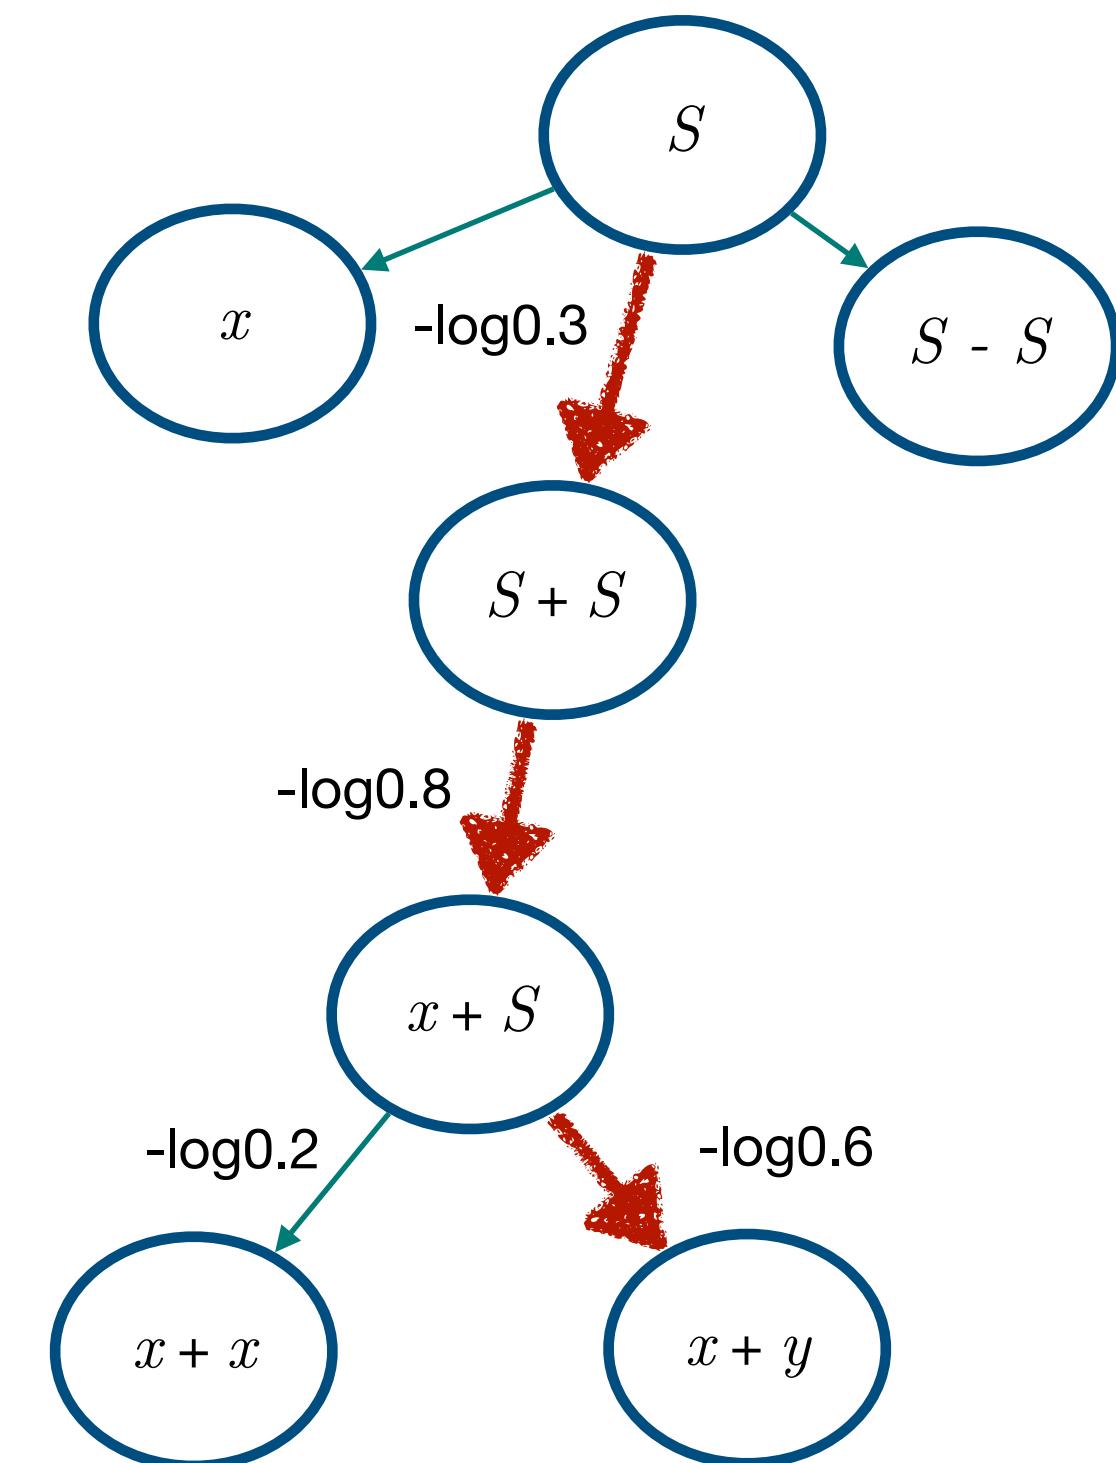

# Example: PCFG

- Probabilistic Context Free Grammar (PCFG)
- One of the simplest form of probabilistic language model: ignore context
- Provide a probability to each production rule

$A \rightarrow \beta$	$P$
$S \rightarrow 0$	0.1
$S \rightarrow 1$	0.2
$S \rightarrow x$	0.3
$S \rightarrow S + S$	0.3
$S \rightarrow S - S$	0.1

# Guided Enumeration by Probabilistic Model

- Given a model, construct a directed graph
  - Node: sentential forms
  - Weight: negative log probability of a production rule
- Compute the shortest path
  - starting from the start symbol to the program
  - E.g., Dijkstra's, A\*, etc

$Pr(S \rightarrow S + S) = 0.3$
$Pr(S \rightarrow x   S + S) = 0.8$
...
$Pr(S \rightarrow x   x + S) = 0.2$
$Pr(S \rightarrow y   x + S) = 0.6$
...

# Experimental Setup

# Effectiveness

- Comparison to EUSolver (a program synthesizer without prob. guidance)
  - Training: 762 tasks solved by EUSolver in 10 minutes
  - Testing: 405 (timeout: 1 hour)

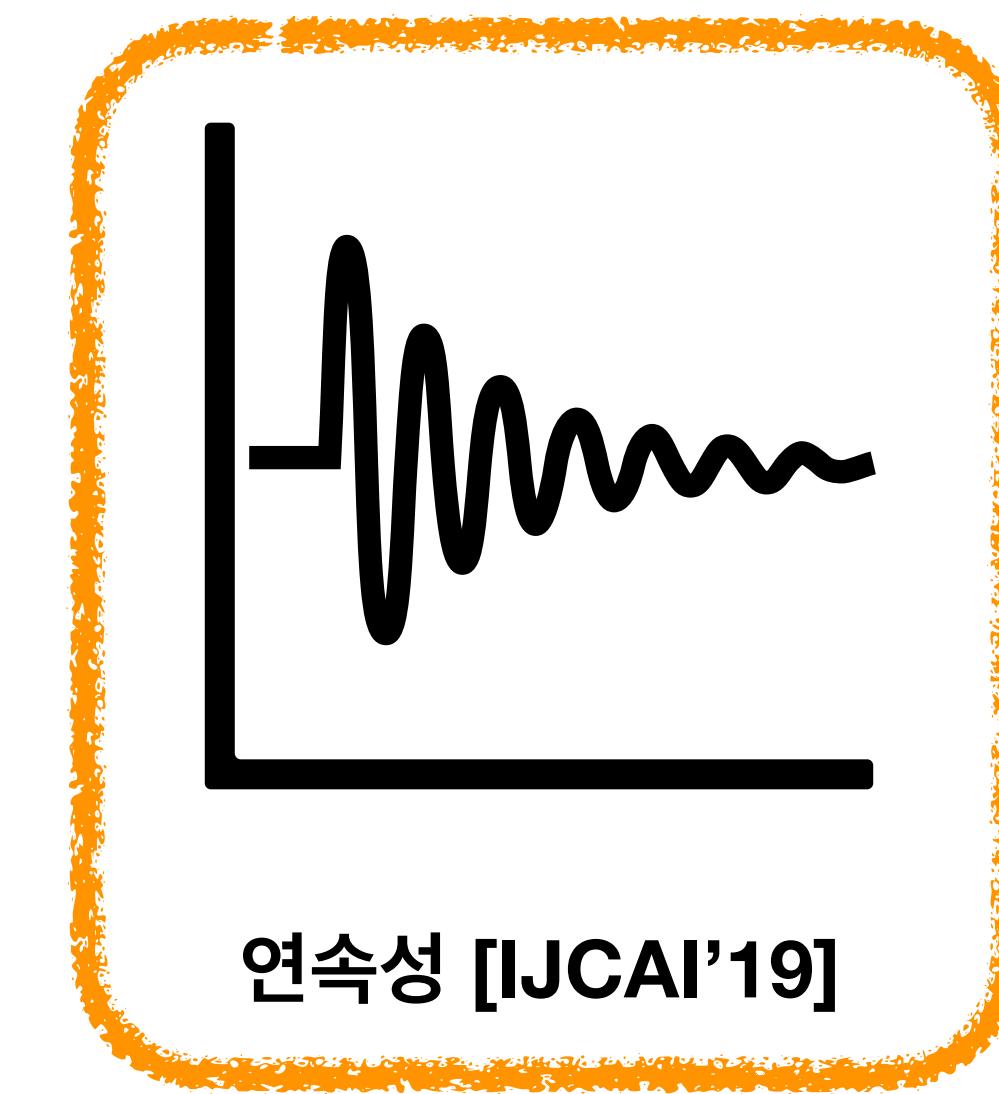

# 세 가지 아이디어

연관성 [CCS'18]

규칙성 [PLDI'18]

연속성 [IJCAI'19]

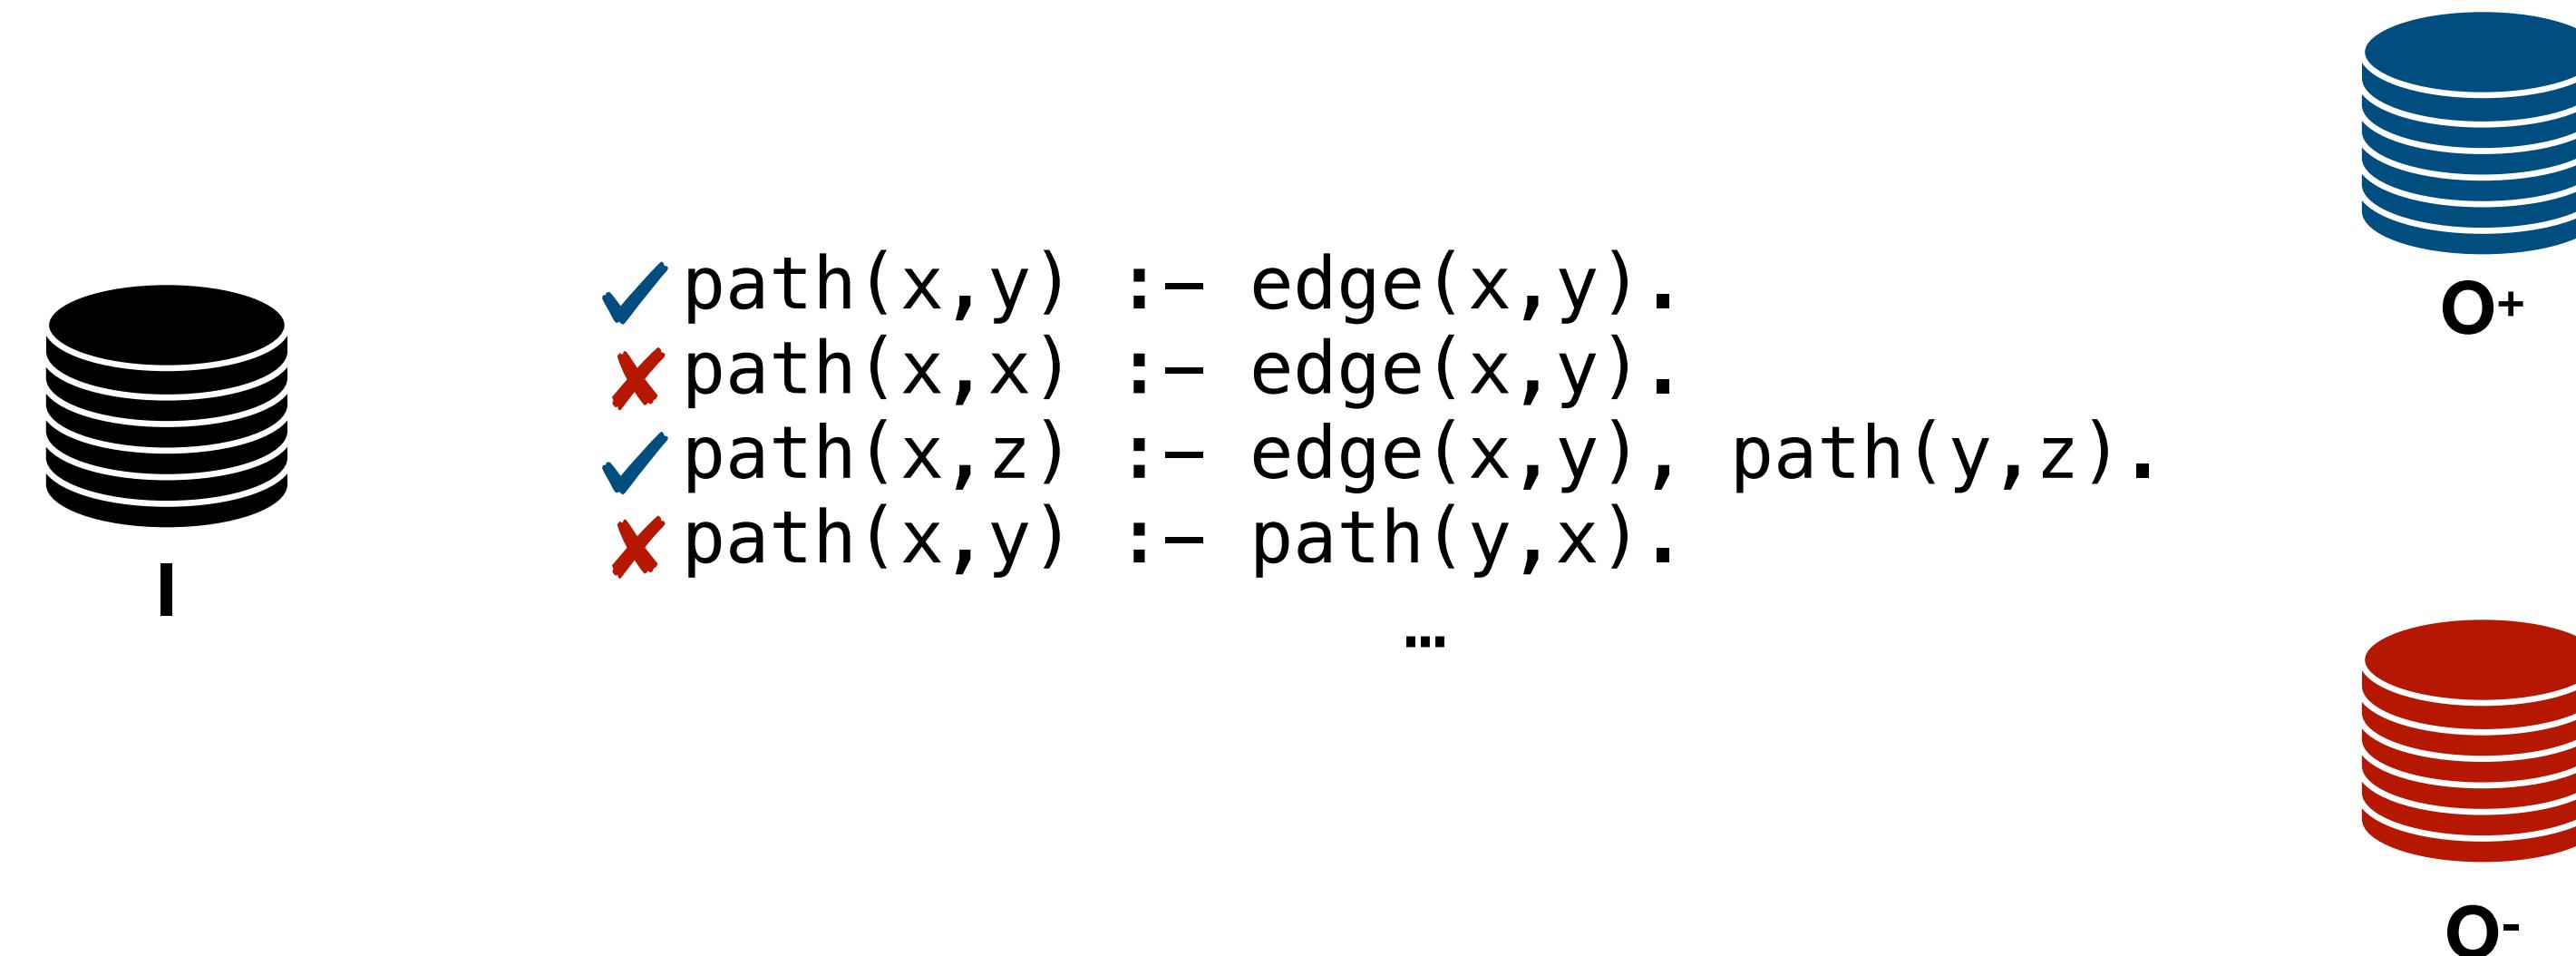

# Datalog 프로그램

- Horn clause 형태로 표현된 1차 논리 규칙의 집합
  - 입력 튜플을 받아서 출력 튜플을 만들어 냄
- 응용: 빅데이터 분석, 네트워크 프로토콜, 프로그램 분석
- 예제: transitive closure

edge(1,2)      edge(2,3)      edge(3,4)       $\rightarrow$  path(x, y) :- edge(x,y).  
                        path(x, z) :- edge(x,y), path(y, z).       $\rightarrow$  path(1,2) path(1,3) path(1,4)  
                        path(2,3) path(2,4)  
                        path(3,4)

# Datalog 프로그램 합성

- 가능한 모든 규칙 중에서 주어진 입출력 예제와 아귀가 맞는 부분 집합 선택 문제
  - 전형인 조합 최적화 문제 (combinatorial optimization), 즉 NP-hard

# 연속적 의미로 변환

- Datalog 프로그램 (불연속 함수) 를 연속 함수로 해석
  - 튜플의 존재 여부 {0, 1} → 튜플의 가중치 [0, 1]
- 그러면, 조합 최적화 문제 → 수치 최적화 문제

**Parameters:**  $\vec{W}$

```

0.7 path(x,y) :- edge(x,y).
0.9 path(x,x) :- edge(x,y).
0.1 path(x,z) :- edge(x,y), path(y,z).
0.3 path(x,y) :- path(y,x).
    
```

**최적화문제:** 다음 식을 최소화하는  $\vec{W}$  를 찾으시오

$$loss = \sum_{t \in pos} (1 - v_t)^2 + \sum_{t \in neg} (0 - v_t)^2$$

Input	edge(1,2)	edge(2,3)
Weight	1.0	1.0

Output	path(1,2)	path(2,3)	path(1,3)	path(1,1)	path(2,1)
Weight ( $v_t$ )	0.7	0.7	0.63	0.1	0.21
Expectation	1	1	1	0	0

# 연속적 실행 의미

0.7 r1: path(x,y) :- edge(x,y).

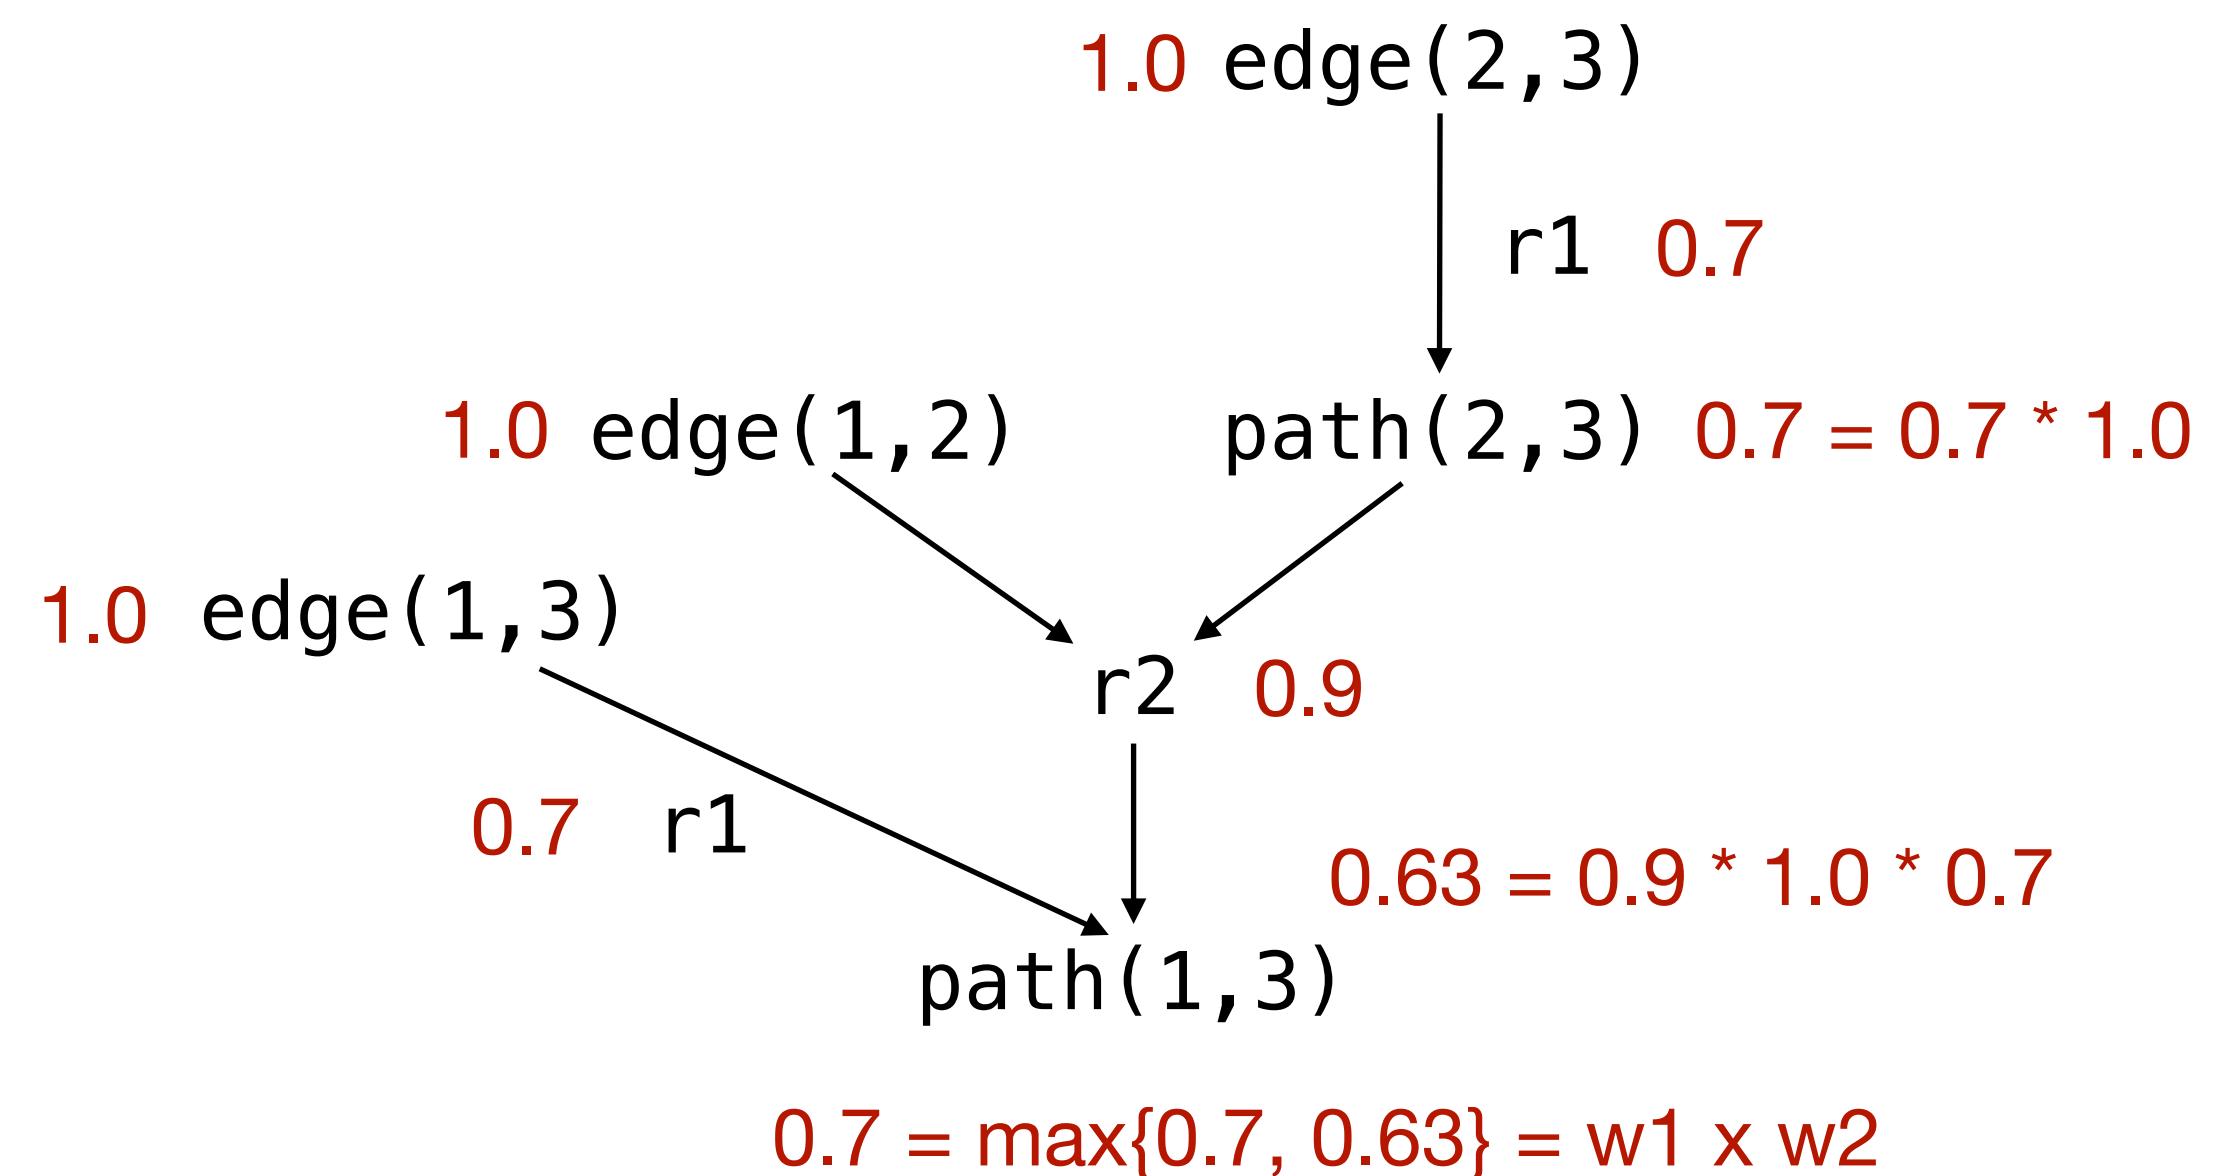

0.9 r2: path(x,z) :- edge(x,y), path(y,z).

원래 실행 의미 (boolean semiring)

$$v_t = \bigvee_g (v_{a_1} \wedge v_{a_2} \wedge \cdots \wedge v_{a_k})$$

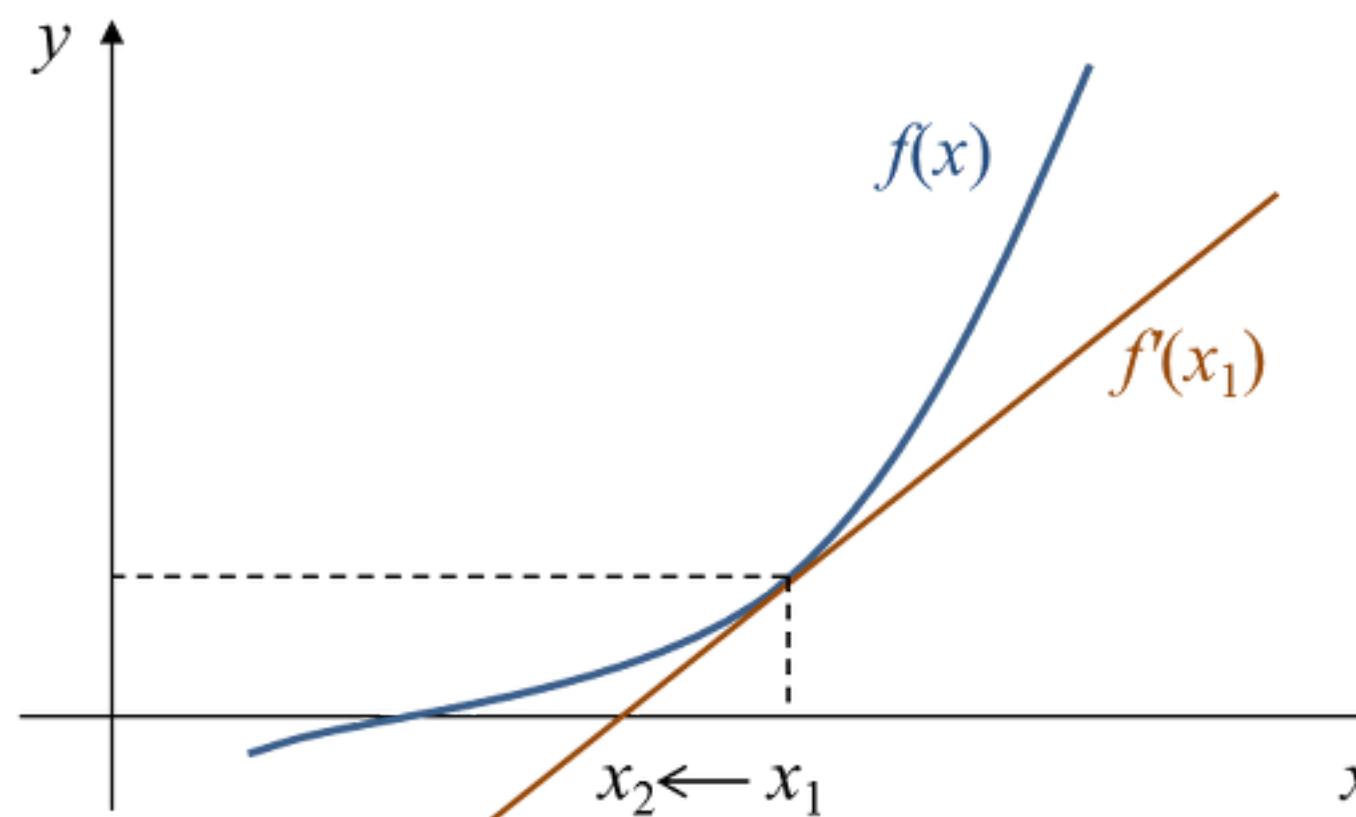

연속적 실행 의미 (Viterbi semiring)

$$v_t = \max_g (w_g \times v_{a_1} \times v_{a_2} \times \cdots \times v_{a_k})$$

# 최적화

- 연속 의미로 실행하고 나면, 각  $v_t$  는  $w_r$ 에 대한 다향식 (미분가능)
- 따라서, 다음 손실 함수도  $w_r$ 에 대한 다향식 (미분가능):  $loss = \sum_{t \in pos} (1 - v_t)^2 + \sum_{t \in neg} (0 - v_t)^2$
- 잘 알려진 연속 최적화 알고리즘을 이용 (예: Newton's method)
  - 손실이 0인 지점 = 원하는 프로그램 = 모든 입출력이 의도에 부합
